Abstract

Let G be an edge-colored connected graph. A path P in G is called ℓ -rainbow if each subpath of length at most $\ell + 1$ is rainbow. The graph G is called (k, ℓ) -rainbow connected if there is an edge-coloring such that every pair of distinct vertices of G is connected by k pairwise internally vertex-disjoint ℓ -rainbow paths in G . The minimum number of colors needed to make G (k, ℓ) -rainbow connected is called the (k, ℓ) -rainbow connection number of G and denoted by $rc_{k,\ell}(G)$. In this paper, we first focus on the $(1, 2)$ -rainbow connection number of G depending on some constraints of $\overline{G}$. Then, we characterize the graphs of order n with $(1, 2)$ -rainbow connection number $n - 1$ or $n - 2$. Using this result, we investigate the Nordhaus-Gaddum-Type problem of $(1, 2)$ -rainbow connection number and prove that $rc_{1,2}(G) + rc_{1,2}(\overline{G}) \leq n + 2$ for connected graphs G and $\overline{G}$. The equality holds if and only if G or $\overline{G}$ is isomorphic to a double star.

Keywords: ℓ -rainbow path, (k, ℓ) -rainbow connected, (k, ℓ) -rainbow connection number.

2010 Mathematics Subject Classification: 04C15, 05C40.
