Abstract

For $k \geq 1$, a k -fair dominating set (or just k FD-set) in a graph G is a dominating set S such that $|N(v) \cap S| = k$ for every vertex $v \in V \setminus S$. The k -fair domination number of G , denoted by $fd_k(G)$, is the minimum cardinality of a k FD-set. A fair dominating set, abbreviated FD-set, is a k FD-set for some integer $k \geq 1$. The fair domination number, denoted by $fd(G)$, of G that is not the empty graph, is the minimum cardinality of an FD-set in G . In this paper, aiming to provide a particular answer to a problem posed in [Y. Caro, A. Hansberg and M.A. Henning, *Fair domination in graphs*, *Discrete Math.* 312 (2012) 2905–2914], we present a new upper bound for the fair domination number of a cactus graph, and characterize all cactus graphs G achieving equality in the upper bound of $fd_1(G)$.

Keywords: fair domination, cactus graph, unicyclic graph.

2010 Mathematics Subject Classification: 05C69.
