Abstract

A 2-rainbow dominating function (2RDF) of a graph $G$ is a function $g$ from the vertex set $V(G)$ to the family of all subsets of \{1,2\} such that for each vertex $v$ with $g(v) = \emptyset$ we have $\bigcup_{u \in N(v)} g(u) = \{1,2\}$. The minimum of $g(V(G)) = \sum_{v \in V(G)} |g(v)|$ over all such functions is called the 2-rainbow domination number. A 2RDF $g$ of a graph $G$ is independent if no two vertices assigned non empty sets are adjacent. The independent 2-rainbow domination number is the minimum weight of an independent 2RDF on $G$.

A Roman \{2\}-dominating function (R2DF) $f : V \to \{0,1,2\}$ of a graph $G = (V,E)$ has the property that for every vertex $v \in V$ with $f(v) = 0$ either there is $u \in N(v)$ with $f(u) = 2$ or there are $x,y \in N(v)$ with $f(x) = f(y) = 1$. The weight of $f$ is the sum $f(V) = \sum_{v \in V} f(v)$. An R2DF $f$ is called independent if no two vertices assigned non-zero values are adjacent. The independent Roman \{2\}-domination number is the minimum weight of an independent R2DF on $G$.

We first show that the decision problem for computing the independent 2-rainbow (respectively, independent Roman \{2\}-domination) number is NP-complete even when restricted to planar graphs. Then, we give a linear algorithm that computes the independent 2-rainbow domination number as well as the independent Roman \{2\}-domination number of a given tree, answering problems posed in [M. Chellali and N. Jafari Rad, Independent 2-rainbow domination in graphs, J. Combin. Math. Combin. Comput. 94]

**Keywords:** independent 2-rainbow dominating function, independent Roman \{2\}-dominating function, algorithm, 3-SAT.

**2010 Mathematics Subject Classification:** 05C85, 05C69.

1. **Introduction**

For notation and terminology not given here we refer to [10]. Let \( G = (V, E) \) be a graph with vertex set \( V \) of order \( n \) and edge set \( E \). The open neighborhood of a vertex \( v \in V \) is \( N(v) = \{u \in V : uv \in E\} \) and the closed neighborhood of \( v \) is \( N[v] = N(v) \cup \{v\} \). The degree of \( v \) is \( \deg(v) = |N(v)| \). A vertex of degree one is referred as a leaf and its unique neighbor is called a support vertex. A tree \( T \) of order \( n \geq 2 \) is called a star if \( n = 2 \) or \( n \geq 3 \) and \( T \) contains exactly one vertex that is not a leaf. A double star is a tree with precisely two vertices (as central vertices) that are not leaves. A path of order \( n \) is denoted by \( P_n \). A unicyclic graph is a graph obtained from a tree \( T \) of order at least three by joining precisely two non-adjacent vertices of \( T \). A planar graph is a graph that can be drawn on the plane in such a way that its edges intersect only at their endpoints.

A function \( f : V \rightarrow \{0, 1, 2\} \) is a Roman dominating function (RDF) of a graph \( G = (V, E) \) if every vertex \( u \) for which \( f(u) = 0 \) is adjacent to at least one vertex \( v \) for which \( f(v) = 2 \). The weight of an RDF \( f \), denoted by \( w(f) \), is the sum \( f(V) = \sum_{v \in V} f(v) \). The minimum weight of an RDF on \( G \) is called the Roman domination number of \( G \) and is denoted by \( \gamma_R(G) \). The mathematical concept of Roman domination, was defined and discussed by Stewart [16], and ReVelle and Rosing [13], and subsequently developed by Cockayne et al. [8]. For an RDF \( f \) on \( G \), we denote by \( V_i \) (or \( V_i^f \) to refer to \( f \)) the set of all the vertices of \( G \) with label \( i \) under \( f \). Thus an RDF \( f \) can be represented by a triple \((V_0, V_1, V_2)\), and we can use the notation \( f = (V_0, V_1, V_2) \).

In a recent paper, Chellali et al. [6] introduced a new variant of Roman dominating functions. A Roman \{2\}-dominating function (R2DF) \( f : V \rightarrow \{0, 1, 2\} \) of \( G \) has the property that for every vertex \( v \in V \) with \( f(v) = 0 \) either there is \( u \in N(v) \) with \( f(u) = 2 \) or there are \( x, y \in N(v) \) with \( f(x) = f(y) = 1 \). The weight of a Roman \{2\}-dominating function \( f \) on \( G \) is the sum \( f(V) = \sum_{v \in V} f(v) \) and the minimum weight of a Roman \{2\}-dominating function \( f \) is the Roman \{2\}-domination number of \( G \), denoted by \( \gamma_{R2}(G) \). Rahmouni and Chellali [12] introduced independent Roman \{2\}-dominating function (IR2DF) as a Roman \{2\}-dominating function \( f = (V_0, V_1, V_2) \) for which \( V_1 \cup V_2 \) is an
Algorithmic Aspects of the Independent 2-Rainbow Domination ... 3

independent set. The independent Roman \( \{2\}\)-domination number of \( G \), denoted by \( i_{(R2)}(G) \), is the minimum weight of an IR2DF on \( G \). They showed that the decision problem associated with \( i_{(R2)}(G) \) is NP-complete even when restricted to bipartite graphs. They posed the following open problem.

**Problem 1** (Rahmouni and Chellali [12]). Can you design a linear algorithm for computing the value of \( i_{(R2)}(T) \) for any tree \( T \)?

Chen and Lu [7] have answered Problem 1 by giving an algorithm that computes the independent Roman \( \{2\}\)-domination number in trees. In this paper we answer Problem 1 by a different approach.

Let \( f \) be a function on the vertex set of a graph \( G \) that assigns to each vertex a set of colors chosen from the set \{1, 2\}; that is \( f : V(G) \rightarrow \mathcal{P}\{(1, 2)\} \), where \( \mathcal{P}(\{1, 2\}) \) is the power set of \{1, 2\}. If for each vertex \( v \in V(G) \) such that \( f(v) = \emptyset \), we have \( \bigcup_{u \in N(v)} f(u) = \{1, 2\} \), then \( f \) is called a 2-rainbow dominating function (2RDF) of \( G \). The weight of a 2RDF \( f \) is defined as \( w(f) = \sum_{v \in V(G)}|f(v)| \).

The minimum weight of a 2-rainbow dominating function is called the 2-rainbow domination number of \( G \), denoted by \( \gamma_{r2}(G) \). We say that a function \( f \) is a \( \gamma_{r2}(G)\)-function if it is a 2RDF and \( w(f) = \gamma_{r2}(G) \). For a 2RDF \( f \) we let \( V_1^f = \{v : f(v) = \{1\}\} \). Similarly, \( V_2^f \), \( V_{12}^f \) and \( V_0^f \) are defined. So, we will write \( f = (V_0^f, V_1^f, V_2^f, V_{12}^f) \).

A function \( f \) is called an independent 2-rainbow dominating function (I2RDF) of \( G \), if \( f \) is a 2RDF and no two vertices in \( V(G) - V_0^f \) are adjacent. The independent 2-rainbow domination number, denoted by \( i_{r2}(G) \), is the minimum weight of an independent 2-rainbow dominating function of \( G \). We say that a function \( f \) is an \( i_{r2}(G)\)-function if it is an I2RDF and \( w(f) = i_{r2}(G) \). The concept of rainbow domination was introduced by Brešar, Henning, and Rall [2], and further studied by several authors (see for example, [1, 3, 5, 14, 15, 17]).

Chellali et al. [4] posed the following problem.

**Problem 2** (Chellali and Jafari Rad [4]). Is there a polynomial algorithm for computing the independent 2-rainbow domination number for trees?

In this paper we study algorithmic and complexity of the independent 2-rainbow domination number as well as the independent Roman \( \{2\}\)-domination number. In Section 2, we show that the decision problem for computing the independent 2-rainbow (respectively, independent Roman \( \{2\}\)-domination) number is NP-complete even when restricted to chordal graphs. In Section 3, we first give a linear algorithm that computes the independent 2-rainbow domination number of a given tree, answering Problem 2. We then answer Problem 1 using the following Corollary 1 of [12]. Then we give a linear algorithm that computes the independent 2-rainbow domination number of a given unicyclic graph.

**Corollary 1** (Rahmouni and Chellali [12]). If \( T \) is a tree, then \( i_{(R2)}(T) = i_{r2}(T) \).
2. NP-Completeness Results

Consider the following decision problems related to the optimization problems of computing the independent 2-rainbow domination number and the independent Roman \{2\}-domination number of a given graph.

**Independent 2-Rainbow Domination (I2RD) Problem:**

**Instance:** A graph \(G\) and a positive integer \(m\).

**Question:** Does an I2RDF \(f\) exist on \(G\) with \(w(f) \leq m\)?

**Independent Roman \{2\}-Domination (IR2D) Problem:**

**Instance:** A graph \(G\) and a positive integer \(m\).

**Question:** Is there an IR2DF \(f\) on \(G\) with \(w(f) \leq m\)?

We introduce a polynomial time reduction from PLANAR 3-SAT Problem to I2RD and IR2D Problems to show that I2RD and IR2D Problems are NP-complete even when restricted to planar graphs. Recall that 3-SAT is the problem of deciding whether a given boolean formula in 3-conjunctive normal form is satisfiable. Let \(\Phi = \{C, X\}\) be an instance in 3-SAT Problem, that is, let \(\Phi\) be a boolean formula in 3-conjunctive normal form. Let \(\mathcal{C} = \{c_1, c_2, \ldots, c_l\}\) be a set of \(l \geq 1\) clauses over a set \(X = \{x_1, \ldots, x_k\}\) of \(k \geq 3\) variables. For each \(1 \leq j \leq l\), the clause \(c_j\) (consisting of exactly three literals) is of the form \(c_j = \{y_{1j}, y_{2j}, y_{3j}\}\), where each of \(y_{1j}, y_{2j}\) and \(y_{3j}\) is either a variable or the negative of a variable in \(X\). A natural graph associated to 3-SAT Problem is the bipartite graph \(G_{(C,X)}\) that has \(C \cup X\) as its vertex set and has an edge between the vertices \(x_i\) and \(c_j\) if \(c_j\) contains either \(x_i\) or \(\neg x_i\). PLANAR 3-SAT is 3-SAT restricted to those instances \(\{C, X\}\) for which \(G_{(C,X)}\) is planar. It is well-know that PLANAR 3-SAT Problem is NP-complete [9, 11]. Let \(\Phi = \{C, X\}\) be an instance of 3-SAT Problem such that the associated graph \(G_{(C,X)}\) to \(\Phi\) is planar. We construct graph \(G_\Phi\) corresponding to \(\Phi\) as follows.

Assume that \(H\) is a planar embedding of \(G_{(C,X)}\). We replace each variable-vertex \(x_i\) of \(H\), where \(1 \leq i \leq k\), by a graph \(H_i\) as variable gadget, where \(H_i\) is obtained from a cycle graph of order \(4l\) with vertices \(u_{i1}^1, \ldots, u_{il}^1\) such that each of vertices \(u_{i}^{4j-3}, u_{i}^{4j-2}, u_{i}^{4j-1}, u_{i}^{4j}\) is adjacent to a new vertex \(v_{ij}^l\) for each \(1 \leq j \leq l\). We replace each clause-vertex \(c_j\) of \(H\), where \(1 \leq j \leq l\), by a new vertex \(z_j\). In the rest we fix indices \(i\) and \(j\), where \(1 \leq i \leq k\) and \(1 \leq j \leq l\). Assume that \(c_{i1}, c_{i2}, \ldots, c_{im}\), where \(1 \leq m \leq l\), is the sequence of all clause-vertices adjacent to \(x_i\) in \(H\) in clockwise direction starting from an arbitrary clause-vertex in \(N_H(x_i)\), that is, \(x_i c_j\) is an edge of \(H\) for each \(j' \in \{i_1, i_2, \ldots, i_m\}\). If \(x_i \in c_{ir}\) (respectively, \(\neg x_i \in c_{jr}\), where \(1 \leq r \leq m\)), then we replace \(x_i c_j\) by new edges \(u_{i}^{4r-2} z_j\) and \(u_{i}^{4r} z_j\) (respectively, \(u_{i}^{4r-3} z_j\) and \(u_{i}^{4r-1} z_j\)). Let \(H_{\Phi}\) be the resulting graph. See Figure 1. It is easy to see that \(H_{\Phi}\) is a planar graph.
Algorithmic Aspects of the Independent 2-Rainbow Domination ... 5

\includegraphics[width=\textwidth]{image.png}
\end{center}

Figure 1. Illustration of replacing clause-vertex \( c_j \) by \( z_j \) for each \( j \in \{1, 3, 4\} \), variable-vertex \( x_i \) by \( H_i \), clause-edge \( x_i c_j \) by edges \( u^2_{ij} z_j \) and \( u^5_{ij} z_j \), clause-edge \( x_i c_4 \) by edges \( u^4_{ij} z_4 \) and \( u^5_{ij} z_4 \) and clause-edge \( x_i c_1 \) by edges \( u^2_{ij} z_1 \) and \( u^4_{ij} z_1 \) for which \( l = 4 \), \( N_H(x_i) = \{ c_3, c_4, c_1 \} \), \( x_i \in c_3 \), \( x_i \in c_4 \) and \( \neg x_i \in c_1 \).

**Lemma 2.** The boolean formula \( \Phi \) is satisfiable if and only if there is an IR2DF (respectively, I2RDF) \( f \) on \( H_\Phi \) with \( w(f) \leq 2kl \).

**Proof.** Assume that \( \Phi \) is satisfiable. Let \( T \) be an assignment of truth values for the variables of \( \mathcal{X} \) for which \( \Phi \) evaluates to \( \text{true} \). We construct sets \( V_1, V'_1 \) and \( V'_2 \) on the vertex set of \( H_\Phi \) as follows. If \( T \) assigns the value \( \text{true} \) to \( x_i \), then we add all vertices in \( \{ u^2_{ij} : 1 \leq j \leq 2l \} \), \( \{ u^4_{ij} : 1 \leq j \leq l \} \) and \( \{ u^5_{ij} : 1 \leq j \leq l \} \) to \( V_1 \), \( V'_1 \) and \( V'_2 \), respectively. If \( T \) assigns the value \( \text{false} \) to \( x_i \), then we add all vertices in \( \{ u^2_{ij} : 1 \leq j \leq 2l \} \), \( \{ u^4_{ij} : 1 \leq j \leq l \} \) and \( \{ u^5_{ij} : 1 \leq j \leq l \} \) to \( V_1 \), \( V'_1 \) and \( V'_2 \), respectively. It is easy to see that \( f = (V(H_\Phi) - V_1, V_1, \emptyset) \) (respectively, \( f = (V(H_\Phi) - (V_1 \cup V_2), V'_1, V'_2, \emptyset) \)) is an IR2DF (respectively, I2RDF) on \( H_\Phi \) with \( w(f) = 2kl \).

Assume that there is an IR2DF \( f = (V_0, V_1, V_2) \) (respectively, I2RDF \( f = (V'_0, V'_1, V'_2, V'_3) \)) on \( H_\Phi \) with \( w(f) \leq 2kl \). Consider values \( f(v^i_1), f(u^4_{ij} - 3) \), \( f(u^4_{ij} - 2), f(u^4_{ij} - 1) \), and \( f(u^4_{ij}) \) for each \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \). Since at least two of vertices \( u^4_{ij} - 3, u^4_{ij} - 2, u^4_{ij} - 1, u^4_{ij} \) are not adjacent to vertex \( z_j \) for all \( 1 \leq j \leq l \), we find that \( S_{ij} = f(v^i_1) + \sum_{s=0}^{3} f(u^4_{ij-s}) \geq 2 \) (respectively, \( S_{ij} = |f(v^i_1)| + \sum_{s=0}^{3} |f(u^4_{ij-s})| \geq 2 \)) for each \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \). So, \( w(f) \geq \sum_{i,j} S_{ij} \geq 2kl \). Since \( w(f) \leq 2kl \), we have \( S_{ij} \geq 2 \). So, \( f(z_j) = 0 \) (respectively, \( |f(z_j)| = 0 \)) for each \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \). Since \( f(z_j) = 0 \) (respectively, \( |f(z_j)| = 0 \)) for each \( 1 \leq j \leq l \), if \( f(v^i_1) \neq 0 \) (respectively, \( |f(v^i_1)| \neq 0 \)) for some \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \), then \( S_{ij} > 2 \), a contradiction. So, \( f(v^i_1) = 0 \) (respectively, \( |f(v^i_1)| = 0 \)) for each \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \). Thus, either both \( f(u^2_{ij} - 1) = 1 \) and \( f(u^2_{ij}) = 0 \) or both \( f(u^2_{ij}) = 0 \) and \( f(u^2_{ij}) = 1 \).
(respectively, either \( f(u_{i}^{4j-1}) \neq \emptyset, f(u_{i}^{4j-3}) \neq \emptyset, f(u_{i}^{4j-1}) \cup f(u_{i}^{4j-3}) = \{1,2\} \) and \( f(u_{i}^{2j}) = \emptyset \) or \( f(u_{i}^{4j}) \neq \emptyset, f(u_{i}^{4j-2}) \neq \emptyset, f(u_{i}^{4j}) \cup f(u_{i}^{4j-2}) = \{1,2\} \) and \( f(u_{i}^{2j-1}) = \emptyset \)) for each \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \).

We fix indices \( i \) and \( j \), where \( 1 \leq i \leq k \) and \( 1 \leq j \leq l \). If both \( f(u_{i}^{2j-1}) = 0 \) and \( f(u_{i}^{2j}) = 1 \) (respectively, \( f(u_{i}^{4j-1}) \neq \emptyset, f(u_{i}^{4j-3}) \neq \emptyset, f(u_{i}^{4j-1}) \cup f(u_{i}^{4j-3}) = \{1,2\} \) and \( f(u_{i}^{2j}) = \emptyset \)), then we assign the value \textit{true} to the variable \( x_{i} \) and if both \( f(u_{i}^{2j-1}) = 1 \) and \( f(u_{i}^{2j}) = 0 \) (respectively, \( f(u_{i}^{4j}) \neq \emptyset, f(u_{i}^{4j}) \cup f(u_{i}^{4j-2}) = \{1,2\} \) and \( f(u_{i}^{2j-1}) = \emptyset \)), then we assign the value \textit{false} to the variable \( x_{i} \). We claim that \( \Phi \) is satisfiable for this assignment.

Assume without loss of generality that \( c_{j} = \{x_{1}, \neg x_{2}, x_{6}\} \). Since \( f(z_{j}) = 0 \) (respectively, \( |f(z_{j})| = 0 \)), we have \( f(u_{i}^{4j-2}) = f(u_{i}^{4j}) = f(u_{i}^{4j-3}) = f(u_{i}^{4j-1}) = 1 \) or \( f(u_{i}^{4j-2}) = f(u_{i}^{4j}) = f(u_{i}^{4j-3}) = 1 \) (respectively, \( f(u_{i}^{4j-2}) \cup f(u_{i}^{4j}) = \{1,2\} \)). Assume without loss of generality that \( f(u_{i}^{4j-2}) = f(u_{i}^{4j-1}) = 1 \) (respectively, \( f(u_{i}^{4j-2}) \cup f(u_{i}^{4j}) = \{1,2\} \)). So, \( x_{1} \) has the value \textit{true}. It causes to satisfy the clause \( c_{j} \), that is, the boolean formula \( \Phi \) is satisfiable. This completes the proof.

Clearly, we can compute \( H_{\Phi} \) in polynomial time. By Lemma 2 and the facts that \( H_{\Phi} \) is a planar graph and both IR2D and I2RD Problems belong to NP we have the following.

**Theorem 3.** Both IR2D and I2RD Problems are NP-complete even when restricted to planar graphs.

### 3. Linear Algorithms for Trees and Unicyclic Graphs

In this section we first give a linear algorithm that computes the independent 2-rainbow domination number as well as the independent Roman \( \{2\} \)-domination number of a given tree. Finally, using the above algorithm we give a linear algorithm that computes the independent 2-rainbow domination number of a given unicyclic graph.
3.1. Trees

In this section, we give a linear algorithm (Algorithm 3.1) that computes the independent 2-rainbow domination number of trees. We say that a rooted tree $T$ with the vertex set $V = \{v_1, v_2, \ldots, v_n\}$ has Property 1 if $j < i$, where $v_j$ is the parent of $v_i \in V$. Let $G = (V, E)$ be a graph such that $u \in V$ and a vertex $v \notin V$. We define the following.

- $i_{r2}(G, u = 0) = \min \{w(f) : f \text{ is an I2RDF on } G \text{ with } f(u) = \emptyset\}$,
- $i_{r2}(G, u = 1) = \min \{w(f) : f \text{ is an I2RDF on } G \text{ with } f(u) = \{1\}\}$,
- $i_{r2}(G, u = 2) = \min \{w(f) : f \text{ is an I2RDF on } G \text{ with } f(u) = \{2\}\}$,
- $i_{r2}(G, u = 12) = \min \{w(f) : f \text{ is an I2RDF on } G \text{ with } f(u) = \{1, 2\}\}$,
- $i'_{r2}(G, u, v = 1) = \min \{w(f) : f \text{ is an I2RDF on } G + uv \text{ with } f(u) = \emptyset \text{ and } f(v) = \{1\}\}$,
- $i'_{r2}(G, u, v = 2) = \min \{w(f) : f \text{ is an I2RDF on } G + uv \text{ with } f(u) = \emptyset \text{ and } f(v) = \{2\}\}$,
- $i'_{r2}(G, u, v = 12) = \min \{w(f) : f \text{ is an I2RDF on } G + uv \text{ with } f(u) = \emptyset \text{ and } f(v) = \{1, 2\}\}$.

**Lemma 4.** Let $H_1 = (V_1, E_1)$ and $H_2 = (V_2, E_2)$ be two graphs with $V_1 \cap V_2 = \emptyset$ such that $u \in V_1$, $v \in V_2$ and a vertex $w \notin V_1 \cup V_2$. Let $G = (V_1 \cup V_2, E_1 \cup E_2 \cup \{uv\})$. Then,

- (i) $i_{r2}(G, u = 0) = i_{r2}(H_1, u = 0) + i_{r2}(H_2, v = 0), i'_{r2}(H_1, u, w = 1) + i_{r2}(H_2, v = 1) - 1, i'_{r2}(H_1, u, w = 2) + i_{r2}(H_2, v = 2) - 1, i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 12) - 2$,
- (ii) $i_{r2}(G, u = 1) = i_{r2}(H_1, u = 1) + i'_{r2}(H_2, v, w = 1) - 1$,
- (iii) $i_{r2}(G, u = 2) = i_{r2}(H_1, u = 2) + i'_{r2}(H_2, v, w = 2) - 1$,
- (iv) $i_{r2}(G, u = 12) = i_{r2}(H_1, u = 12) + i'_{r2}(H_2, v, w = 12) - 2$,
- (v) $i'_{r2}(G, u, w = 1) = \min \{i'_{r2}(H_1, u, w = 1) + i_{r2}(H_2, v = 0), i'_{r2}(H_1, u, w = 1) + i_{r2}(H_2, v = 1), i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 2) - 1, i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 12) - 1\}$,
- (vi) $i'_{r2}(G, u, w = 2) = \min \{i'_{r2}(H_1, u, w = 2) + i_{r2}(H_2, v = 0), i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 1) - 1, i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 2) + i_{r2}(H_2, v = 2), i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 12) - 1\}$,
- (vii) $i'_{r2}(G, u, w = 12) = \min \{i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 0), i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 1), i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 2), i'_{r2}(H_1, u, w = 12) + i_{r2}(H_2, v = 12)\}$.

**Proof.** Let $f$ be a 2RDF on $G$ and let $f_1$ and $f_2$ be restrictions of $f$ to $H_1$ and $H_2$, respectively. Let $f' = g(w) \cup f$, $f'_1 = g(w) \cup f_1$ and $f'_2 = g(w) \cup f_2$, where $g(w) \in \{\emptyset, \{1\}, \{2\}, \{1, 2\}\}$. 

Algorithm 3.1: I2RDNT(T)

Input: A connected rooted tree T with V(T) = \{v_1, \ldots, v_n\}, Property 1 and a vertex w \notin V(T).

Output: (i_{r_2}(T, v_1 = 0), i_{r_2}(T, v_1 = 1), i_{r_2}(T, v_1 = 2), i_{r_2}(T, v_1 = 12),

\text{i}_{r_2}'(T, v_1, w = 1), i_{r_2}'(T, v_1, w = 2), i_{r_2}'(T, v_1, w = 12)).

Clearly, f(u) \in \{0, \{1\}, \{2\}, \{1, 2\}\} and f(v) \in \{0, \{1\}, \{2\}, \{1, 2\}\}. Clearly, f(u) = A if and only if f(u) = A and f(v) = \emptyset, f(u) = A and f(v) = \{1\}, f(u) = A and f(v) = \{2\} or f(u) = A and f(v) = \{1, 2\} for each A \in \emptyset, \{1\}, \{2\}, \{1, 2\}.

Let f(u) = 0. Hence, f is an I2RDF on G with f(u) = \emptyset if and only if f_1 is an I2RDF on H_1 with f_1(u) = \emptyset and f_2 is an I2RDF on H_2 with f_2(v) = \emptyset, f_1' is an I2RDF on H_1 + uw with both f_1'(u) = \emptyset and f_1'(v) = \{1\} and f_2 is an I2RDF on H_2 with f_2(v) = \{1\}, f_1' is an I2RDF on H_1 + uw with both f_1'(u) = \emptyset and f_1'(v) = \{2\} and f_2 is an I2RDF on H_2 with f_2(v) = \{2\} or f_1' is an I2RDF on H_1 + uw with both f_1'(u) = \emptyset and f_1'(v) = \{1, 2\} and f_2 is an I2RDF on H_2 with f_2(v) = \{1, 2\}. This completes the proof of part (i).

Let f(u) = \{1\}. Hence, f is an I2RDF on G with f(u) = \{1\} if and only if f_1 is an I2RDF on H_1 with f_1(u) = \{1\} and f_2 is an I2RDF on H_2 + vw with both f_2(v) = \emptyset and f_2'(w) = \{1\}. This completes the proof of part (ii).
Let $f(u) = \{2\}$. Hence, $f$ is an I2RDF on $G$ with $f(u) = \{2\}$ if and only if $f_1$ is an I2RDF on $H_1$ with $f_1(u) = \{2\}$ and $f'_2$ is an I2RDF on $H_2 + vw$ with both $f'_2(v) = \emptyset$ and $f'_2(w) = \{2\}$. This completes the proof of part (iii).

Let $f(u) = \{1, 2\}$. Hence, $f$ is an I2RDF on $G$ with $f(u) = \{1, 2\}$ if and only if $f_1$ is an I2RDF on $H_1$ with $f_1(u) = \{1, 2\}$ and $f'_2$ is an I2RDF on $H_2 + vw$ with both $f'_2(v) = \emptyset$ and $f'_2(w) = \{1, 2\}$. This completes the proof of part (iv).

Let $f'(u) = \emptyset$ and $f'(w) = \{1\}$. Hence, $f'$ is an I2RDF on $G + uw$ with both $f'(u) = \emptyset$ and $f'(w) = \{1\}$ if and only if $f'_1$ is an I2RDF on $H_1 + uw$ with both $f'_1(u) = \emptyset$ and $f'_1(w) = \{1\}$ and $f_2$ is an I2RDF on $H_2 + uw$ with both $f_2(v) = \emptyset$, $f_2'(v) = \{1\}$ and $f_2(w) = \{1, 2\}$. This completes the proof of part (v).

Let $f'(u) = \emptyset$ and $f'(w) = \{2\}$. Hence, $f'$ is an I2RDF on $G + uw$ with both $f'(u) = \emptyset$ and $f'(w) = \{2\}$ if and only if $f'_1$ is an I2RDF on $H_1 + uw$ with both $f'_1(u) = \emptyset$ and $f'_1(w) = \{1, 2\}$ and $f_2$ is an I2RDF on $H_2 + uw$ with both $f_2(v) = \emptyset$, $f_2'(v) = \{2\}$ and $f_2(w) = \{1, 2\}$. This completes the proof of part (vi).

Let $f'(u) = \emptyset$ and $f'(w) = \{1, 2\}$. Hence, $f'$ is an I2RDF on $G + uw$ with both $f'(u) = \emptyset$ and $f'(w) = \{1, 2\}$ if and only if $f'_1$ is an I2RDF on $H_1 + uw$ with both $f'_1(u) = \emptyset$ and $f'_1(w) = \{1, 2\}$ and $f_2$ is an I2RDF on $H_2 + uw$ with both $f_2(v) = \emptyset$, $f_2'(v) = \{1\}$ and $f_2(w) = \{1, 2\}$. This completes the proof of part (vii).

**Lemma 5.** Let $T$ be a tree with $u \in V(T)$ and a vertex $w \notin V(T)$. Algorithm 3.1 computes values $i_{r_2}(T, u = a)$ and $i'_{r_2}(T, u, w = b)$ in linear time for each $a \in \{0, 1, 2, 12\}$ and $b \in \{1, 2, 12\}$.

**Proof.** We can compute a rooted tree $T'$ with Property 1 and the root $u$ for $T$ in linear time. Clearly, $i_{r_2}(T, u = a) = i_{r_2}(T', u = a)$ and $i'_{r_2}(T, u, w = b) = i'_{r_2}(T', u, w = b)$ for each $a \in \{0, 1, 2, 12\}$ and $b \in \{1, 2, 12\}$. By Lemma 4, Algorithm I2RDN(T') computes these values. The running time of each iteration of the for loops of Algorithm I2RDN(T') is $O(1)$ and so the running time of Algorithm 3.1 is linear. This completes the proof.
The following is clear.

**Corollary 6.** Let $G = (V, E)$ be a graph such that $u \in V$. Then, $i_{r2}(G) = \min\{i_{r2}(G, u = 0), i_{r2}(G, u = 1), i_{r2}(G, u = 2), i_{r2}(G, u = 12)\}$.

By Corollaries 1 and 6 and Lemma 5 we have the following.

**Theorem 7.** There is a linear algorithm that computes the independent 2-rainbow domination number and the independent Roman $\{2\}$-domination number of a given tree.

Note that Theorem 7 provides answers to Problems 1 and 2.

### 3.2. Computing independent 2-rainbow domination number of unicyclic graphs

In this section using Algorithm 3.1 we give a linear algorithm that computes the independent 2-rainbow domination number of a given unicyclic graph. Recall that a connected unicyclic graph is a connected graph with a unique cycle. Let $A, C \in \{\{1\}, \{2\}, \{1, 2\}\}$ and $B \in \{\emptyset, \{1\}, \{2\}, \{1, 2\}\}$, let $G = (V, E)$ be a graph with $u, v \in V$ and vertices $w, z \notin V$. We define the following.

- $i_{r2}(G, u = \emptyset, v = B) = \min\{w(f) : f$ is an I2RDF on $G$ with $f(u) = \emptyset$ and $f(v) = B\}$,
- $i_{r2}(G, u = B, v = \emptyset) = \min\{w(f) : f$ is an I2RDF on $G$ with $f(u) = B$ and $f(v) = \emptyset\}$,
- $i'_{r2}(G, u = A, v = B) = \min\{w(f) : f$ is an I2RDF on $G + uw$ with $f(u) = \emptyset, f(w) = A$ and $f(v) = B\}$,
- $i''_{r2}(G, u = A, v = C) = \min\{w(f) : f$ is an I2RDF on $G + uw$ with $f(u) = f(v) = \emptyset, f(w) = A$ and $f(v) = C\}$,

Let $G$ be a connected unicyclic graph with the unique cycle $C = v_0, \ldots, v_k$ for some $k \geq 3$. Define $T(v_0, R) = U - v_0v_1$. Clearly, $T(v_0, R)$ is a tree with the vertex set $V(U)$.

**Lemma 8.** Let $U$ be a connected unicyclic graph with the unique cycle $v_0, \ldots, v_k$ for some $k \geq 2$ with a vertex $w \notin V(U)$ and let $A \in \{\{1\}, \{2\}, \{1, 2\}\}$. Then, $i_{r2}(U) = \min\{i_{r2}(T(v_0, R), v_0 = \emptyset, v_1 = \emptyset), i'_{r2}(T(v_0, R), v_0 = A, v_1 = A) - |A|, i''_{r2}(T(v_0, R), v_1, w = A, v_0 = A) - |A|\}$.

**Proof.** Assume that $i_{r2} = \min\{i_{r2}(T(v_0, R), v_0 = \emptyset, v_1 = \emptyset), i'_{r2}(T(v_0, R), v_0 = A, v_1 = A) - |A|, i''_{r2}(T(v_0, R), v_1, w = A, v_0 = A) - |A|\}$, where $A \in \{\{1\}, \{2\}, \{1, 2\}\}$.

Let $f$ be an I2RDF on $T(v_0, R)$ with $f(v_0) = f(v_1) = \emptyset$ and $w(f) = i_{r2}(T(v_0, R), v_0 = \emptyset, v_1 = \emptyset)$. Then, $f$ is an I2RDF on $U$ and so $i_{r2}(U) \leq i_{r2}(T(v_0, R), v_0 = \emptyset, v_1 = \emptyset)$. 

Let $f$ be an I2RDF on $T(v_0, R) + v_0 w$ with $f(v_0) = \emptyset$, $f(v_1) = f(w) = A$ and $w(f) = i'_2(T(v_0, R), v_0, w = A, v_1 = A)$. Then, the restriction of $f$ to $V(T)$ is an I2RDF on $U$ and so $i_{r2}(U) \leq i'_2(T(v_0, R), v_0, w = A, v_1 = A) - |A|$.

Similarly, $i_{r2}(U) \leq i'_2(T(v_0, R), v_1, w = A, v_0 = A) - |A|$. So, $i_{r2}(U) \leq i_{r2}$.

Let $f$ be an I2RDF on $U$ with $w(f) = i_{r2}(U)$. We have either both $f(v_0) = \emptyset$ and $f(v_1) \in \{1, 2, \{1, 2\}\}$ or both $f(v_1) = \emptyset$ and $f(v_0) \in \{1, 2, \{1, 2\}\}$.

In the following we consider these cases.

- Let $f(v_0) = f(v_1) = \emptyset$. Then $f$ is an I2RDF on $T(v_0, R)$ with $f(v_0) = f(v_1) = \emptyset$ and so $i_{r2}(T(v_0, R), v_0 = \emptyset, v_1 = \emptyset) \leq i_{r2}(U)$.

- Let $f(v_0) = \emptyset$ and $f(v_1) = g(w) = A$, where $A \in \{1, 2, \{1, 2\}\}$. Then, $h = f \cup g$ is an I2RDF on $T(v_1, R) + v_0 w$ with $h(v_0) = \emptyset$ and $h(v_1) = h(w) = A$ and so $i'_2(T(v_0, R), v_0, v_1 = A, w = A) - |A| \leq i_{r2}(U)$.

- Similar to the previous case, if $f(v_1) = \emptyset$ and $f(v_0) = g(w) = A$, where $A \in \{1, 2, \{1, 2\}\}$, then $i'_2(T(v_0, R), v_1, v_0 = A, w = A) - |A| \leq i_{r2}(U)$.

So, $i_{r2} \leq i_{r2}(U)$. This completes the proof.

By Lemma 8 for computing the independent 2-rainbow domination number of a given unicyclic graph we need to compute $i_{r2}(T, u = v, v = \emptyset)$ and $i'_2(T, u, w = A, v = A)$, where $A \in \{1, 2, \{1, 2\}\}$ and $T$ is a tree with $u, v \in V(T)$ and a vertex $w \notin V(T)$. We claim that Algorithms 3.2, 3.3, 3.4 and 3.5 compute these values. We define $P_T(v, u)$ as the shortest path between $v$ and $u$ in $T$.

**Lemma 9.** Let $T$ be a rooted tree with the root $u$, $v \in V(T)$ and a vertex $w \notin V(T)$. Let $(a_0, \ldots, a_6)$ be the output of Algorithm I2RDNT0($T, u, v$). Then,

- $a_0 = i_{r2}(T, v = \emptyset, u = \emptyset)$,
- $a_1 = i_{r2}(T, v = \emptyset, u = \{1\})$,
- $a_2 = i_{r2}(T, v = \emptyset, u = \{2\})$,
- $a_3 = i_{r2}(T, v = \emptyset, u = \{1, 2\})$,
- $a_4 = i'_2(T, u, w = \{1\}, v = \emptyset)$,
- $a_5 = i'_2(T, u, w = \{2\}, v = \emptyset)$,
- $a_6 = i'_2(T, u, w = \{1, 2\}, v = \emptyset)$.

**Proof.** Let $P_T(v, u) = w_0(= v) \ldots, w_k(= u)$, where $k > 0$. The proof is by induction on $k = |P_T(v, u)|$. Let $k = 1$. So, $u$ is the parent of $v$. Let $T' = T_u - T_v$.

So,

- $i_{r2}(T, v = \emptyset, u = \emptyset) = i_{r2}(T_v, v = 0) + i_{r2}(T', u = 0)$,
- $i_{r2}(T, v = \emptyset, u = \{1\}) = i'_2(T_v, v, w = 1) + i_{r2}(T', u = 1) - 1$,
- $i_{r2}(T, v = \emptyset, u = \{2\}) = i'_2(T_v, v, w = 2) + i_{r2}(T', u = 2) - 1$,
- $i_{r2}(T, v = \emptyset, u = \{1, 2\}) = i'_2(T_v, v, w = 12) + i_{r2}(T', u = 12) - 2$.
Algorithm 3.2: I2RDNT0(T, u, v)

Input: A rooted tree T with the root u, v ∈ V(T) and a vertex w ∈ V(T).
Output: i_{2}(T, v = \emptyset, u = A), i_{2}'(T, u, w = B, v = \emptyset) : A ∈ \{\emptyset, \{1\}, \{1, 2\}\}, B ∈ \{\{1\}, \{2\}, \{1, 2\}\}.

• i''_2(T, u, w = \{2\}, v = \emptyset) = \min(i''_2(T', w_i = 2) + b_0, i''_2(T', w_i = 12) + b_6 - 2,
Algorithm 3.5: I2RDNT12(T, u, v)

Input: A rooted tree T with root u, v ∈ V(T) and vertices w, z ∈ V(T).
Output: \{i′_{r,2}(T, v, w = \{1, 2\}, u = A), i′_{r,2}(T, v, w = \{1, 2\}, u, z = B) : A ∈ \{\emptyset, \{1\}, \{2\}, \{1, 2\}\}, B ∈ \{\{1\}, \{2\}, \{1, 2\}\}\}. 

1. Let \(P_T(u, v) = w_0(= v), ..., w_k(= u)\).
2. \(T' = T_{w_1} - T_{w_0}\);
3. \(i_{120} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 0)\);
4. \(i_{121} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 1)\);
5. \(i_{122} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 2)\);
6. \(i'_{121} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 12)\);
7. \(i'_{122} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 2)\);
8. \(i'_{122} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 2)\);
9. \(i'_{121} = i'_{r,2}(T_{w_0}, w_0, w = 12) + i_{122}(T', w_1 = 12)\);

for \(i = 2\) to \(k\) do
10. \(T' = T_{w_i} - T_{w_{i-1}}\);
11. \(\alpha_{120} = \min\{i_{r,2}(T', w_i = 0) + i_{120}, i'_{r,2}(T', w_i, w = 1) + i_{121} - 1, i'_{r,2}(T', w_i, w = 2) + i_{122} - 1, i'_{r,2}(T', w_i, w = 12) + i_{121} - 2\};\)
12. \(\alpha_{121} = i_{r,2}(T', w_i = 1) + i_{121} - 1\);
13. \(\alpha_{122} = i_{r,2}(T', w_i = 2) + i_{122} - 1\);
14. \(\alpha_{1212} = i_{r,2}(T', w_i = 12) + i_{122} - 2\);
15. \(i'_{121} = \min\{i'_{r,2}(T', w_i, w = 1) + i_{120}, i'_{r,2}(T', w_i, w = 1) + i_{121} - 1, i'_{r,2}(T', w_i, w = 12) + i_{122} - 1\};\)
16. \(i'_{122} = \min\{i'_{r,2}(T', w_i, w = 2) + i_{120}, i'_{r,2}(T', w_i, w = 12) + i_{121} - 1\};\)
17. \(i'_{1212} = \min\{i'_{r,2}(T', w_i, w = 12) + i_{120}, i'_{r,2}(T', w_i, w = 12) + i_{122} - 1\};\)
18. \(i_{1212} = i'_{r,2}(T', w_i, w = 12) + \min\{i_{120}, i_{121}, i_{122}, i_{1212}\};\)
19. \(i_{120} = \alpha_{120}; i_{121} = \alpha_{121}; i_{122} = \alpha_{122}; i_{1212} = \alpha_{1212};\)

20. return \(i_{120}, i_{121}, i_{122}, i_{1212}, i'_{122}, i'_{1212}\);

\[ b_1 - 1, i'_{r,2}(T', w, w_i = 2) + b_2, i'_{r,2}(T', w, w_i = 12) + b_3 - 1, \]
\[ i'_{r,2}(T, u, w = \{1, 2\}, v = \emptyset) = i'_{r,2}(T', w, w_i = 12) + \min\{b_0, b_1, b_2, b_3\}. \]

This completes the proof.

Similar to Lemma 9 we have the following.

**Theorem 10.** Let T be a rooted tree with the root u, v ∈ V(T) and vertices w, z ∈ V(T). Let \(q_0, ..., q_k\) be the output of Algorithm I2RDNT1(T, u, v). Then,

- \(a_0 = i'_{r,2}(T, v, w = \{1\}, u = \emptyset)\),
- \(a_1 = i'_{r,2}(T, v, w = \{1\}, u = \{1\})\),
- \(a_2 = i'_{r,2}(T, v, w = \{1\}, u = \{2\})\),
Theorem 13. There is a linear algorithm that computes the independent 2-rainbow domination number of a given unicyclic graph.

Proof. Let \( U \) be a connected unicyclic graph with the unique cycle \( v_0, \ldots, v_{k-1}, v_0 \) such that a vertex \( w \notin V(U) \). By Lemma 8, \( i_r(U) = \min(i_r(T(v_0, R), v_0 = \emptyset, v_1 = \emptyset), i_r(T(v_0, R), v_0, w = A, v_1 = A) - |A|, i_r(T(v_0, R), v_1, w = A, v_0 = A) - |A| \), where \( A \in \{\{1\}, \{2\}, \{1, 2\}\} \). Let \( T_u \) be a rooted tree of \( T(v_0, R) \) with the root \( u \) and let \( v \in V(T_u) \). Clearly, \( i_r(T(v_0, R), v = A, u = A) = i_r(T_u, v = A, u = A) \) and \( i_r(T(v_0, R), v, w = A, u = A) = i_r(T_u, v, w = A, u = A) \), where \( A \in \{\{1\}, \{2\}, \{1, 2\}\} \). It follows from Lemmas 9, 10, 11 and 12 that Algorithms 3.2, 3.3, 3.4 and 3.5 compute \( i_r(U) \).

It remains to compute the running time of these algorithms. Let \( P(T, v, u) = w_0(= v), \ldots, w_k(= u) \), where \( k > 0 \). Clearly, we can compute \( T_u \) and \( P(T, v, u) \) in linear time. Let \( T_m \) be the value of variable \( T' \) of Algorithm 12RDNT0(T, u, v)

- \( a_3 = i_r'(T, v, w = \{1\}, u = \{1, 2\}) \),
- \( a_4 = i_r'(T, v, w = \{1\}, u, z = \{1\}) \),
- \( a_5 = i_r'(T, v, w = \{1\}, u, z = \{2\}) \),
- \( a_6 = i_r'(T, v, w = \{1\}, u, z = \{1, 2\}) \).

 Lemma 11. Let \( T \) be a rooted tree with the root \( u \), \( v \in V(T) \) and a vertex \( w \notin V(T) \). Let \((a_0, \ldots, a_6)\) be the output of Algorithm 12RDNT2(T, u, v). Then,
- \( a_0 = i_r'(T, v, w = \{2\}, u = \emptyset) \),
- \( a_1 = i_r'(T, v, w = \{2\}, u = \{1\}) \),
- \( a_2 = i_r'(T, v, w = \{2\}, u = \{2\}) \),
- \( a_3 = i_r'(T, v, w = \{2\}, u = \{1, 2\}) \),
- \( a_4 = i_r'(T, v, w = \{2\}, u, z = \{1\}) \),
- \( a_5 = i_r'(T, v, w = \{2\}, u, z = \{2\}) \),
- \( a_6 = i_r'(T, v, w = \{2\}, u, z = \{1, 2\}) \).

 Lemma 12. Let \( T \) be a rooted tree with the root \( u \), \( v \in V(T) \) and a vertex \( w \notin V(T) \). Let \((a_0, \ldots, a_6)\) be the output of Algorithm 12RDNT12(T, u, v). Then,
- \( a_0 = i_r'(T, v, w = \{1, 2\}, u = \emptyset) \),
- \( a_1 = i_r'(T, v, w = \{1, 2\}, u = \{1\}) \),
- \( a_2 = i_r'(T, v, w = \{1, 2\}, u = \{2\}) \),
- \( a_3 = i_r'(T, v, w = \{1, 2\}, u = \{1, 2\}) \),
- \( a_4 = i_r'(T, v, w = \{1, 2\}, u, z = \{1\}) \),
- \( a_5 = i_r'(T, v, w = \{1, 2\}, u, z = \{2\}) \),
- \( a_6 = i_r'(T, v, w = \{1, 2\}, u, z = \{1, 2\}) \).
Algorithmic Aspects of the Independent 2-Rainbow Domination ...17

after the iteration of the for loop for each $2 \leq m \leq k$. By Lemma 5, the running
time of lines 2–9 of Algorithm I2RDNT0($T, u, v$) is $O(V(T_i))$ and the running
time of the iteration of the for loop of Algorithm I2RDNT0($T, u, v$) for $2 \leq m \leq k$
is $O(V(T_m))$. Clearly, $V(T_i) \cap V(T_j) = \emptyset$ for each $2 \leq i < j \leq k$. So, the running
time of Algorithm I2RDNT0($T, u, v$) is equal to $\sum_{i=2}^{k} O(V(T_m)) = O(V(T))$ and
so the running time of Algorithm 3.2 is linear. Similarly, the running times of
Algorithms of 3.3, 3.4 and 3.5 are linear. This completes the proof.
