# PLACING BIPARTITE GRAPHS OF SMALL SIZE II 

Beata Orchel

Institute of Mathematics, Academy of Mining and Metallurgy al. Mickiewicza 30, 30-059 Kraków, Poland

#### Abstract

In this paper we give all pairs of non mutually placeable $(p, q)$ bipartite graphs $G$ and $H$ such that $2 \leq p \leq q, e(H) \leq p$ and $e(G)+$ $e(H) \leq 2 p+q-1$.

Keywords: packing of graphs, bipartite graph.
1991 Mathematics Subject Classification: 05C70.

## 1. Definitions

For a bipartite graph $G=(L, R ; E)$ with the vertex set $V(G)=L \cup R$ and the egde set $E(G)=E$ we denote by $L=L(G)$ and $R=R(G)$ the left and the right set of bipartition of the vertex set of $G$, while the cardinality of the set is denoted by $e(G)$. For example, the graphs $G=(\{a, b\},\{c, d\} ;\{a c, a d\})$ and $G^{\prime}=(\{c, d\},\{a, b\} ;\{a c, a d\})$ shown in Figure 1 are different.

We denote by $N(x, G)$ the set of the neighbors of the vertex $x$ in $G$. The degree $d(x, G)$ of the vertex $x$ in $G$ is the cardinality of the set $N(x, G)$; $\Delta_{L}(G)\left(\delta_{L}(G)\right), \Delta_{R}(G)\left(\delta_{R}(G)\right)$ and $\Delta(G)(\delta(G))$ are the maximum (minimum) of the vertex degree in the sets $L(G), R(G)$ and $V(G)$, respectively.

A vertex $x$ of $G$ is said to be pendent if $d(x, G)=1 . K_{p q}$ stands for the complete bipartite graph with $\left|L\left(K_{p q}\right)\right|=p$ and $\left|R\left(K_{p q}\right)\right|=q$. A bipartite graph $G$ is called $(p, q)$-bipartite if $|L(G)|=p$ and $|R(G)|=q$. If $p=q$, then $G$ is called balanced.

Two graphs $G$ and $H$ of the same order are packable if $G$ can be embedded in the complement $\bar{H}$ of $H$. If $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ are two $(p, q)$-bipartite graphs, then we say that $G$ and $H$ are mutually placeable (or just m.p.) if there is a bijection $f: L \cup R \rightarrow L^{\prime} \cup R^{\prime}$ such that $f(L)=L^{\prime}$ and $f(x) f(y)$ is not an of $H$ whenever $x y$ is an of $G$. The function $f$ is called bi-placement of $G$ and $H$. For example, the graphs $G=(\{a, b\},\{c, d, e, f\} ;\{a c, a d, b e, b f\})$ and $H=\left(\left\{a^{\prime}, b^{\prime}\right\},\left\{c^{\prime}, d^{\prime}\right.\right.$, $\left.e^{\prime}, f^{\prime}\right\} ;\left\{a^{\prime} c^{\prime}, b^{\prime} c^{\prime}\right\}$ ) are not m.p. but $G$ and $H$ are packable. (See Figure 2).

G

H

Figure 2
If a graph $G=(L, R ; E)$ is a subgraph of a graph $F=\left(L, R^{\prime} ; E^{\prime}\right)$, then $L \subseteq L^{\prime}, R \subseteq R^{\prime}, E \subseteq E^{\prime}$ and we write $G \leq F$.

## 2. Introduction

The classical "marriage theorem" of Frobenius [5] and Philip Hall's Theorem [6] may also be formulated as concerning the mutual placement of a matching and a bipartite graph. Richard Rado in [9] has proved a theorem in traversal theory, which may easily be transformed into a necessary and sufficient condition for two bipartite graphs to be mutually placeable (see [11]). So, even if the mutual placement of bipartite graphs has been introduced in [4], it is clear that the problem of mutual placeability of bipartite graphs is at least eighty years old.

The purpose of this paper is to characterize all pairs of $(p, q)$-bipartite graphs $G$ and $H$ such that $e(G)+e(H) \leq 2 p+q-1, e(H) \leq p, 2 \leq p \leq q$
and $G$ and $H$ are not mutually placeable. For this reason we introduce now several graphs and families of graphs.

A $(p, q)$-bipartite graph of size $q$ or $p$ is said to be left side bistar $S L(p, q)$ or right side bistar $S R(p, q)$, respectively, if there is a vertex of the degree $q$ or $p$, respectively, in its left or right, respectively, set of bipartition. If a $(p, q)$-bipartite graph $G$ verifies $S L(p, q) \leq G$ or $S R(p, q) \leq G$, then $G$ is an element of the set which we denote $\mathcal{S}^{\prime} L(p, q)$ or $\mathcal{S}^{\prime} R(p, q)$, respectively. $\mathcal{D} R(p, q)$ or $\mathcal{D} L(p, q))$ is the set of $(p, q)$-bipartite graphs $G$ such that there is no isolated vertex in $R(G)$ or $L(G)$, respectively. $\mathcal{B}^{\prime} L(p, p)$ or $\mathcal{B}^{\prime} R(p, p)$ is the set of balanced bipartite graphs $G$ of size $2 p$ such that each vertex of $R(G)$ or $L(G)$, respectively has degree two. $B L(p, p)$ or $B R(p, p)$ is the ( $p, p$ )-bipartite graph of size $2 p$ which has two vertices of degree $p$ in its left or right, respectively, set of bipartition. Clearly, $B L(p, p) \in \mathcal{B}^{\prime} L(p, p)$ and $B R(p, p) \in \mathcal{B}^{\prime} R(p, p) . \mathcal{Z}^{\prime} L(p, p)$ or $\mathcal{Z}^{\prime} R(p, p)$ is the set of the $(p, p)$-bipartite graphs $G$ of size $p-1$ such that for each vertex in $L(G)$ or $R(G)$, respectively, its degree is at most one. $Z L(p, p)$ or $Z R(p, p)$ is the $(p, p)$-bipartite graph of size $p-1$ such that $Z L(p, p) \in \mathcal{Z}^{\prime} L(p, p)$ or $Z R(p, p) \in \mathcal{Z}^{\prime} R(p, p)$ and there is a vertex of degree $p-1$ in its right or left, respectively, set of bipartition. We define $\mathcal{Z}_{L}(p, p)$ to be the set of pairs of ( $p, p$ )-bipartite graphs $(G, H)$ such that either

$$
\begin{aligned}
& G=B L(p, p) \text { and } H \in \mathcal{Z}^{\prime} L(p, p) \text { (see Figure 3) or } \\
& G \in \mathcal{B}^{\prime} L(p, p) \text { and } H=Z L(p, p) \text { (see Figure 4). }
\end{aligned}
$$

Figure 3

Figure 4
The set $\mathcal{Z}_{R}(p, p)$ we define analogically. By $\mathcal{Z}(p, p)$ we denote the set of graphs $\mathcal{Z}_{L}(p, p) \cup \mathcal{Z}_{R}(p, p)$. It is not difficult to see that $\mathcal{Z}(p, p)$ is a set of pairs of $(p, p)$-bipartite graphs $(G, H)$ which are not bi-placeable, $e(G)=2 p$ and $e(H)=p-1$.

In a $(p, q)$-bipartite graph $G=(L, R ; E)$ we denote by $P_{k}(R)$ or $P_{k}(L)$ the set of the $k$-element subsets of the set $R$ or $L$, respectively. Let $A_{k} \in$ $P_{k}(R)$. Define $N\left(A_{k}\right)$ to be the set of such vertices $x$ that there is a vertex $y$ in $A_{k}$ such that $x y$ is an edge in $E(G)$. By $T\left(A_{k}\right)$ we denote the set of vertices $z$ which are adjacent to each vertex in the set $A_{k}$. We denote by $n\left(A_{k}\right)$ and $t\left(A_{k}\right)$ the cardinalities of the sets $N\left(A_{k}\right)$ and $T\left(A_{k}\right)$, respectively.

By $W(p, q)$ we denote the set of graphs such that

$$
W(p, q)=\bigcup_{i=1}^{6} W_{i}(p, q), \quad \text { where }
$$

$W_{i}(p, q)$ is the set of the pairs of $(p, q)$-bipartite graphs $(G, H)$ such that $p \leq q, e(H)=p, e(G) \leq p+q-1$ and $W_{1}(p, q)=\left\{(G, H):\left(G \in \mathcal{S}^{\prime} L(p, q)\right.\right.$ and $H \in \mathcal{D} L(p, q))$ or $\left(p=q, G \in \mathcal{S}^{\prime} R(p, p)\right.$ and $\left.H \in \mathcal{D} R(p, p)\right)$ or $(G \in \mathcal{D} R(p, q)$ and $H=\mathcal{S} R(p, q))$ or $(p=q, G \in \mathcal{D} L(p, p)$ and $H=\mathcal{S} L(p, p))\}$ (see Figure $5 \mathrm{a}, 5 \mathrm{~b}, 5 \mathrm{c}, 5 \mathrm{~d})$.

Figure 5a

Figure 5d
$W_{2}(p, q)=\{(G, H): q=p+1$, for each vertex in $L(G)$ its degree is two and there is a vertex of the degree $p$ in $L(H)\}$ (see Figure 6),

Figure 6
$W_{3}(p, q)=\left\{(G, H): q=p+1\right.$, there are two vertices $y$ and $y^{\prime}$ in $R(G)$ such that $d(y, G)=d\left(y^{\prime}, G\right)=p$ and for each vertex in $R(H)$ its degree is at most one\} (see Figure 7),

Figure 7
$W_{4}(p, q)=\{(G, H)$ : either there is a vertex $x$ in $L(G)$ such that its degree is $q-1$ and the degree of the vertex $y \in L$ non adjacent to $x$ is at least two, each vertex in $L(H)$ is pendent, the degree of each non isolated vertex in $R(H)$ is at least $p-d(y, G)+1$ (see Figure 8) or $p=q$, there is a vertex $y$ in $R(G)$ such that its degree is $p-1$ and the degree of the vertex $x \in L$ non
adjacent to $y$ is at least two, each vertex in $R(H)$ is pendent, the degree of each non isolated vertex in $L(H)$ is at least $q-d(x, G)+1\}$. In the latter case we say that $(G, H) \in W_{4^{\prime}}$.

Figure 8
$W_{5}(p, q)=\left\{(G, H):\left(p=3, q=3, G=C_{4} \cup K_{1,1}, H=P_{3} \cup \overline{K_{1,1}}\right.\right.$ or $p=4$, $\left.q=4, G=K_{1,1} \cup C_{6}, H=C_{4} \cup \overline{K_{2,2}}\right\}$ (see Figure $9 \mathrm{a}, 9 \mathrm{~b}$ ),

Figure 9a

Figure 9b
$W_{6}(p, q)=\left\{(G, H): p K_{1,1} \leq H\right.$ and there is an integer $k$ in the set $\{1, \ldots, p\}$ and a set $A_{k} \in P_{k}(L)$ such that $\left.q-t\left(A_{k}\right)<k\right\}$ (see Figure 10).

Figure 10
We denote by $W^{\prime}(p, q)$ the subset $\bigcup_{i=1}^{5} W_{i}(p, q)$ of the set $W(p, q)$ and by $V(p, q)$ the set $\mathcal{Z}(p, p) \cup W(p, q)$.

## 3. Results

Consider graphs $G$ and $G^{\prime}$ with $n$ vertices such that $\Delta(G), \Delta\left(G^{\prime}\right)<n-1$. The main packing theorem proved by Bollobás and Eldridge [2] shows that if we impose the extra condition: $e(G)+e\left(G^{\prime}\right) \leq 2 n-3$ then, with finitely many exceptions ( 7 pairs), $G$ and $G^{\prime}$ are packable.
S.T. Teo and H.P. Yap [10] proved that if $e(G)+e\left(G^{\prime}\right) \leq 2 n-2, n \geq 5$, then the number of forbidden pairs is 49 .
J.-L. Fouquet and A.P. Wojda proved in [4] the following theorem.

Theorem A. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs, $p, q \geq 2$, such that $e(G)+e(H) \leq p+q$. Then $G$ and $H$ are m.p. unless $\{G, H\}=\left\{F_{1}, F_{2}\right\}$, where either $F_{1}=S L(p, q)$ and $F_{2} \in \mathcal{D} L(p, q)$ or $F_{1}=S R(p, q)$ and $F_{2} \in \mathcal{D} R(p, q)$.

Theorem B was proved in [8].
Theorem B. Let $G$ and $H$ be two $(p, q)$-bipartite graphs such that $e(G) \leq$ $p+q, e(H) \leq p-1, p \leq q$. Then $G$ and $H$ are m.p. unless $p=q, e(G)=2 p$, $e(H)=p-1$ and $(G, H) \in \mathcal{Z}(p, p)$.

In this paper we give a necessary and sufficient condition for two $(p, q)$ bipartite graphs $G$ and $H$ such that $2 \leq p \leq q, e(H) \leq p$ and $e(G)+e(H) \leq$ $2 p+q-1$ to be m.p.

The main result of this paper is Theorem 1.
Theorem 1. Let $G$ and $H$ be two $(p, q)$-bipartite graphs such that $p \leq q$, $e(H) \leq p$ and $e(G)+e(H) \leq 2 p+q-1$. Then $G$ and $H$ are m.p. unless $e(H) \geq p-1$ and $(G, H) \in V(p, q)$.

## 4. Proof of Theorem 1

### 4.1. Bi-placement of two $(p, q)$-bipartite graphs $G$ and $H$ such that $\Delta(H)=1$

Remark 1.1. Let $G=(L, G ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs such that $p \leq q, \Delta(H)=1, e(H) \leq p-1$ and $e(G) \leq p+q-1$. Then $G$ and $H$ are m.p.

Remark 1.2. If $G$ and $H$ are two $(p, q)$-bipartite graphs such that $e(H)=p$, $p K_{1,1} \leq H$, then $G$ and $H$ are m.p. if and only if there is a matching of the cardinality $p$ in the graph $G^{\prime}=K_{p, q}-G$.

Theorem of Philip Hall. Let $G=(L, G ; E)$ be a $(p, q)$-bipartite graph. Then $G$ has matching of cardinality $p$ if and only if for each integer $k \in$ $\{1, \ldots, p\}$, for each set $A_{k} \in P_{k}(L)$

$$
k \leq n\left(A_{k}\right) .
$$

The following theorem is a corollary from Remark 1.2.
Theorem 1.3. Let $G$ and $H$ be two $(p, q)$-bipartite graphs such that $p \leq q$, $e(H)=p$ and $\Delta(H)=1$. Then $G$ and $H$ are m.p. unless $(G, H) \in W_{6}(p, q)$.
4.2. Placing two $(p, q)$-bipartite graphs $G$ and $H$ such that $\Delta(H) \geq 2$

We shall prove two lemmas first.
Lemma 2.1. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs such that $2 \leq p \leq q, \Delta(H) \geq 2, e(G) \leq p+q-1, e(H) \leq p$, there is a vertex $x$ in $L$ such that $d(x, G)=q-1$, the degree of the vertex $y \in R-N(x, G)$ is at least two and $\Delta_{L}(H)=1$. Then $G$ and $H$ are mutually placeable unless either $(G, H) \in W_{1}(p, q)$ or $(G, H) \in W_{4}(p, q)$.

Proof. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs verifying the assumptions of the lemma. If $e(H) \leq p-1$ then $H$ and $G$ are m.p. by Theorem B. Now we suppose that $e(H)=p$ and $e(G) \leq p+q-1$. If $(G, H) \in W_{1}(p, q)$ or $(G, H) \in W_{4}(p, q)$, then clearly $G$ and $H$ are not mutually placeable. Let $d(y, G)=k$. We may assume that there exists a vertex $w$ in $R^{\prime}$ such that $0<d(w, H)=k^{\prime} \leq p-k$. Let us define sets $Z$ and $Z^{\prime}$ and graphs $G^{\prime}, H^{\prime}$ in the following way:

$$
\begin{aligned}
& Z \subseteq L-N(y, G), x \in Z \text { and }|Z|=k^{\prime} ; Z^{\prime}=N(w, H), \\
& G^{\prime}=G-Z-\{y\}, H^{\prime}=H-Z^{\prime}-\{w\} .
\end{aligned}
$$

$G^{\prime}$ and $H^{\prime}$ are $\left(p-k^{\prime}, q-1\right)$-bipartite graphs, $e\left(G^{\prime}\right) \leq p-k, e\left(H^{\prime}\right)=p-k^{\prime}$. By the Theorem A, $G^{\prime}$ and $H^{\prime}$ are mutually placeable. Hence a bi-placement of $G$ and $H$ is evident.

Lemma 2.2. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs such that $2 \leq p \leq q, e(G) \leq p+q-1, e(H) \leq p, \Delta(H) \geq 2$, $\Delta_{L}(H)=1$ and there is no isolated vertex in $R$. Then $G$ and $H$ are m.p. unless either $(G, H) \in W_{1}(p, q)$ or $(G, H) \in W_{4}(p, q)$.

Proof. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs verifying the assumptions of the lemma. We may suppose that $e(G) \leq p+q-1, e(H)=p$ and each vertex in $L^{\prime}$ is pendent (if $e(H)<p$ we may use Theorem B). If there is a vertex of degree $q$ in $L$, then $(G, H) \in W_{1}(p, q)$. It is clear that there is a pendent vertex, say $y$, in $R$. Let us take a vertex $w$ in $R^{\prime}$ such that $d(w, H)=\Delta_{R}(H) \geq 2$. If $d(w, H)=p$ then $(G, H) \in W_{1}(p, q)$. If $d(w, H)<p$ then, by Theorem B, there is a biplacement $f: L^{\prime} \cup R^{\prime}-\{w\} \rightarrow L \cup R-\{y\}$ of the graphs $H^{\prime}=H-\{w\}$ and $G^{\prime}=G-\{y\}$. If $f[N(w, H)] \subseteq L-N(y, G)$, then a bi-placement of $H$ and $G$ is evident. So now, we may assume that $N(y, G) \cap f[N(w, H)] \neq \emptyset$. Put $\{x\}=N(y, G)$. Let us denote by $z$ the vertex in $L^{\prime}$ such that $z \in N(w, H)$ and $f(z)=x$. If there is a non isolated vertex $w^{\prime}$ in $R^{\prime}-\{w\}$ such that $f\left(w^{\prime}\right)=y^{\prime} \in R-N(x, G)$, we take a vertex $z^{\prime}$ in $L^{\prime}$ such that $z^{\prime} \in N\left(w^{\prime}, H\right)$ and the vertex $x^{\prime}=f\left(z^{\prime}\right) \in L$. Now $g$ defined by

$$
\begin{aligned}
& g(s)=f(s) \text { if } s \in V(H)-\left\{w, z, z^{\prime}\right\} \\
& g\left(z^{\prime}\right)=x, g(z)=x^{\prime}, g(w)=y
\end{aligned}
$$

is a bi-placement of $H$ and $G$. So we assume that $f\left(w^{\prime}\right) \in N(x, G)$ for each non isolated vertex $w^{\prime}$ in $R^{\prime}-\{w\}$. Since $d(w, H)=\Delta_{R}(H)$, then $d\left(w^{\prime}, H\right) \leq$ $d(w, H)$. Hence $d\left(w^{\prime}, H\right) \leq p / 2$. We may assume that there is a vertex $y^{\prime} \in R-N(x, G)$ such that $d\left(y^{\prime}, G\right)+d\left(w^{\prime}, H\right) \leq p$. The above condition is true unless $d(x, G)=q\left(\right.$ then $\left.(G, H) \in W_{1}(p, q)\right)$ or $d(x, G)=q-1$ and $d\left(y^{\prime \prime}, G\right)>p / 2$ for $y^{\prime \prime} \notin N(x, G)$ (in this case we may use Lemma 2.1). Let us denote by $w^{\prime \prime}$ such a vertex of $R^{\prime}$ that $f\left(w^{\prime \prime}\right)=y^{\prime}$. Let $w^{\prime}$ be a non isolated vertex in $R^{\prime}-\{w\}, y^{\prime \prime}=f\left(w^{\prime}\right), z^{\prime} \in N\left(w^{\prime}, H\right)$ and $f\left(z^{\prime}\right)=x^{\prime}$. If $f\left[N\left(w^{\prime}, H\right)\right] \cap N\left(y^{\prime}, G\right)=\emptyset$, then we define by $g$ a new bi-placement of $H-\{w\}$ and $G-\{y\}$ in the following way:

$$
\begin{aligned}
& g(s)=f(s) \text { if } s \in V(H)-\left\{w, w^{\prime}, w^{\prime \prime}, z, z^{\prime}\right\} \\
& g\left(w^{\prime}\right)=y^{\prime}, g\left(w^{\prime \prime}\right)=y^{\prime \prime}, g(z)=x^{\prime}, g\left(z^{\prime}\right)=x
\end{aligned}
$$

Now a bi-placement of $H$ and $G$ is evident. If $f\left[N\left(w^{\prime}, H\right)\right] \cap N\left(y^{\prime}, G\right)=A \neq \emptyset$ let us denote elements of the set $A$ by $x_{i}^{\prime}, i=1,2, \ldots, l$; by $z_{i}^{\prime}$ such elements of the set $L^{\prime}$ that $f\left(z_{i}^{\prime}\right)=x_{i}^{\prime}$. Let $B=L-\left(N\left(y^{\prime}, G\right) \cup f\left[N\left(w^{\prime}, H\right)\right]\right) \cup\{x\}$. Let us denote elements of the set $B$ by $x_{i}, i=1,2, \ldots, k, x_{1}=x$ and by $z_{i}$ such elements of the set $L^{\prime}$ that $f\left(z_{i}\right)=x_{i}$. Since $d\left(y^{\prime}, G\right)+d\left(w^{\prime}, H\right) \leq p$,
$l \leq k$. So now we define a bi-placement $g$ of $H-\{w\}$ and $G-\{y\}$ such that

$$
\begin{aligned}
& g(s)=f(s) \text { if } s \in V(H)-\left\{\left\{z_{1}, z_{2}, \ldots, z_{l}, z_{1}^{\prime}, \ldots z_{l}^{\prime}\right\} \cup\left\{w, w^{\prime}, w^{\prime \prime}\right\}\right\} \\
& g\left(z_{i}\right)=x_{i}^{\prime}, g\left(z_{i}^{\prime}\right)=x_{i}, i=1,2, \ldots, l, \\
& g\left(w^{\prime}\right)=y^{\prime}, g\left(w^{\prime \prime}\right)=y^{\prime \prime} .
\end{aligned}
$$

It is clear now that $H$ and $G$ are m.p.
Theorem 2.3. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$ bipartite graphs such that $2 \leq p \leq q, \Delta(H) \geq 2, e(G) \leq p+q-1, e(H) \leq p$. Then $G$ and $H$ are m.p. unless $e(H)=p$ and $(G, H) \in W^{\prime}(p, q)$.
Proof. The proof is by induction on $p+q$. It is not difficult to check that the theorem is true for $p=2$ and arbitrary $q \geq p$ and for $p+q \leq 8$. Let us assume that $p \geq 3, p \leq q, p+q \geq 9$ and every two ( $p^{\prime}, q^{\prime}$ )-bipartite graphs $G^{\prime}$ and $H^{\prime}$, with $p^{\prime}+q^{\prime}<p+q$ verifying the assumptions of the theorem, are m.p. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs such that $p \geq 3, p \leq q$ and $\Delta(H) \geq 2$. By Theorem B we may assume that $e(H)=p$ and $e(G) \leq p+q-1$. To prove the theorem we shall distinguish two cases.

Case 1. There is an isolated vertex, say $y$, in $R$. If there is no isolated vertex in $L^{\prime}$, then for each vertex in $L^{\prime}$ its degree is one. Then there is a vertex $w$ in $R^{\prime}$ such that its degree is at least two, otherwise $\Delta(H)=1$. Let $x \in L$ be such that $d(x, G)=\Delta_{L}(G)$ and let $z \in N(w, H) . G-\{x, y\}$ and $H-\{w, z\}$ are m.p. by the induction hypothesis when $\Delta(H-\{z, w\})>1$ or by Remark 1.1 when $\Delta(H-\{z, w\})=1$. Hence also $G$ and $H$ are m.p. So now, let $z$ be an isolated vertex in $L^{\prime}, w \in R^{\prime}$ such that $d(w, H)=\Delta_{R}(H)$, and $x \in L$ such that $d(x, G)=\Delta_{L}(G)$. If $d(w, H) \geq 2$, then the graphs $G^{\prime}=G-\{x, y\}$ and $H^{\prime}=H-\{w, z\}$ are $(p-1, q-1)$-bipartite and $e\left(G^{\prime}\right) \leq(p-1)+(q-1)-1, e\left(H^{\prime}\right) \leq p-2$. Hence, by the induction hypothesis or Remark 1.1, $G^{\prime}$ and $H^{\prime}$ are m.p. A bi-placement of $G$ and $H$ is evident. If $d(w, H)=1$, then $e\left(H^{\prime}\right)=p-1$ and if $\Delta\left(H^{\prime}\right) \geq 2$, then by the induction hypothesis, $G^{\prime}$ and $H^{\prime}$ are m. p. unless $\left(G^{\prime}, H^{\prime}\right) \in W^{\prime}(p-1, q-1)$. (If $(p-1) K_{1,1} \leq H^{\prime}$, then there are two pendent adjacent vertices $w^{\prime}$ and $z^{\prime}$ in $H^{\prime}$. We may take $H^{\prime}=H-\left\{w^{\prime}, z^{\prime}\right\}$ and $\Delta\left(H^{\prime}\right) \geq 2$.) Observe that $\left(G^{\prime}, H^{\prime}\right) \notin W_{5}(p-1, q-1)$. Hence we may assume that $\left(G^{\prime}, H^{\prime}\right) \in$ $\bigcup_{i=1}^{4} W_{i}(p-1, q-1)$. Below we consider all possible cases.

1. $\left(G^{\prime}, H^{\prime}\right) \in W_{1}(p-1, q-1)$
(a) $G^{\prime} \in \mathcal{S}^{\prime} R(p-1, q-1)$ and $H^{\prime} \in \mathcal{D} R(p-1, q-1)$. Then $p=q$ and we may use Lemma 2.2.
(b) $G^{\prime} \in \mathcal{S}^{\prime} L(p-1, q-1)$ and $H^{\prime} \in \mathcal{D} L(p-1, q-1)$. There is a vertex $x^{\prime}$ in $L-\{x\}$ such that $d\left(x^{\prime}, G\right)=q-1$. Since $d(x, G)=\Delta_{L}(G)$, then $d(x, G)=q-1$ and $e(G) \geq 2(q-1)$. Hence $p=q$ or $p=q-1$. We may choose a pendent vertex $z^{\prime}$ in $L^{\prime}$ and a vertex $w^{\prime}$ in $N\left(z^{\prime}, H\right)$. If $p=q$ let us define the graphs $G^{\prime \prime}=G-\left\{x, x^{\prime}, y\right\}$ and $H^{\prime \prime}=H-\left\{z, w^{\prime}, z^{\prime}\right\}$, where $z^{\prime} \in L^{\prime} \backslash\{z\}$ and $w^{\prime} \in N\left(z^{\prime}\right)$. By the Theorem A $G^{\prime \prime}$ and $H^{\prime \prime}$ are m.p. Hence $G$ and $H$ are m.p. too. If $p=q-1$, then any function $f$ such that $f(x)=z, f\left(x^{\prime}\right)=z^{\prime}, f(y)=w^{\prime}$ is a bi-placement of $G$ and $H$.
(c) $G^{\prime} \in \mathcal{D} R(p-1, q-1)$ and $H^{\prime}=S R(p-1, q-1)$. We can check that in this case $p=2$.
(d) $G^{\prime} \in \mathcal{D} L(p-1, q-1)$ and $H^{\prime}=S L(p-1, q-1)$. Now $p=q$ and if $w \in N\left(z^{\prime}, H\right)$, where $d\left(z^{\prime}, H^{\prime}\right)=p-1$, then $(G, H) \in W^{\prime}(p, p)$. If $w \notin N\left(z^{\prime}, H\right)$, then a bi-placement of $G$ and $H$ is evident unless $G \in \mathcal{S}^{\prime} R(p, p)$ and $(G, H) \in W^{\prime}(p, p)$.
2. $\left(G^{\prime}, H^{\prime}\right) \in W_{2}(p-1, q-1)$. Now we have: $p=q-1, d(x, G)=2$ and for each vertex in $L$ its degree is two. Let $z_{1}$ be a vertex in $L^{\prime}$ of degree $p-1$ in H'. If $d\left(z_{1}, H\right)=p$, then $(G, H) \in W_{2}(p, p+1)$. Now we suppose that $w \notin N\left(z_{1}, H\right)$. If there are two vertices of degree $p$ in $R$, then $(G, H) \in W_{3}(p, p+1)$. In other case there is a non isolated vertex in $R$, say $y_{1}$, of degree less than $p$. Let $x_{1} \in N\left(y_{1}, G\right), y_{2} \in N\left(x_{1}, G\right)-\left\{y_{1}\right\}$, $z_{2} \in N(w, H)$. Any bijection $f$ such that: $f\left(z_{1}\right)=x_{1}, f(w)=y_{1}$, $f\left(z_{2}\right) \in L-N\left(y_{1}, G\right), f\left[N\left(z_{1}, H\right)\right]=R-\left\{y_{1}, y_{2}\right\}$ is a bi-placement of $G$ and $H$.
3. $\left(G^{\prime}, H^{\prime}\right) \in W_{3}(p-1, q-1)$. Let $y_{1}, y_{2}$ be vertices in $R-\{y\}$ of degree $p-1$ in $G^{\prime}$. If $d\left(y_{1}, G\right)=d\left(y_{2}, G\right)=p$ or $\Delta_{L}(H)=p$, then $(G, H) \in W^{\prime}(p, q)$. Now we assume that $x \notin N\left(y_{1}, G\right)$ and $\Delta_{L}(H)<p$. Let $z_{1}$ be a vertex in $L^{\prime}$ such that $2 \leq d\left(z_{1}, H\right) \leq p-1$. Let $x_{1} \in L-\{x\}$. Then $y_{1}$, $y_{2} \in N\left(x_{1}, G\right)$ and $d\left(y_{1}, G\right) \leq d\left(y_{2}, G\right)$. Let $w_{1}$ be isolated in $R^{\prime}$. The graphs $G^{\prime \prime}=G-\left\{x, x_{1}, y, y_{1}\right\}$ and $H^{\prime \prime}=H-\left\{z, z_{1}, w, w_{1}\right\}$ are m.p. A function, say $f$, defined by $f(s)=g(s), s \in V\left(H^{\prime \prime}\right)$, where $g-$ a biplacement of $H^{\prime \prime}$ and $G^{\prime \prime}, f\left(z_{1}\right)=x, f(z)=x_{1}, f(w)=y, f\left(w_{1}\right)=y_{1}$ is a bi-placement of $H$ and $G$.
4. $\left(G^{\prime}, H^{\prime}\right) \in W_{4}(p-1, q-1)$ Let $x^{\prime} \in L-\{x\}$ be such that $d\left(x^{\prime}, G^{\prime}\right)=q /-2$, hbox $y^{\prime} \in\left(R-N\left(x^{\prime}, G^{\prime}\right)-\{y\}\right)$. Notice that $d\left(y^{\prime}, G^{\prime}\right) \leq p-2$. For each non isolated vertex $w^{\prime}$ in $R^{\prime}-\{w\} d\left(w^{\prime}, H^{\prime}\right)+d\left(y^{\prime}, G^{\prime}\right)>p-1$. But $\Delta_{R}\left(H^{\prime}\right)=1$. Hence $d\left(y^{\prime}, G^{\prime}\right) \geq p-1$ a contradiction. If $\left(G^{\prime}, H^{\prime}\right) \in$ $W_{4^{\prime}}(p-1, p-1)$, then we may use Lemma 2.2.

Case 2. There is no isolated vertex in $R$. Notice that there is a pendent vertex, say $y$, in $R$. If each vertex in $L^{\prime}$ is pendent then we may use Lemma 2.2. So we assume that there is an isolated vertex $z$ in $L^{\prime}$. Let $w \in R^{\prime}$ be such that $d(w, H)=\Delta_{R}(H)$. Now we consider two subcases.

Subcase 2.1. The degree of the vertex $w$ is at least two. If $d(x, G) \geq 2$ for $x \in N(y, G)$ then, by the induction hypothesis, there is a bi-placement of $H-\{z, w\}$ and $G-\{x, y\}$. A bi-placement of $H$ and $G$ is evident. If $d(x, H)=1$, then we define the pair of graphs $\left(G^{\prime}, H^{\prime}\right)$ in the following way:

- if $d(w, H) \geq 3$ put $G^{\prime}=G-\left\{x, y, y^{\prime}\right\}, H^{\prime}=H-\left\{z, w, w^{\prime}\right\}$, where $y^{\prime}$ is a vertex in $R$ such that $e\left(G-\left\{x, x^{\prime}, y\right\}\right) \leq p+q-4$, and $w^{\prime}$ is isolated in $R^{\prime}$;
- if $d(w, H)=2$ and there is a non isolated vertex $z^{\prime}$ in $L^{\prime}-N(w, H)$ then put $G^{\prime}=G-\left\{x, x^{\prime}, y\right\}, H^{\prime}=H-\left\{w, z, z^{\prime}\right\}$, where $x^{\prime} \in L$ such that $e\left(G-\left\{x, x^{\prime}, y\right\}\right) \leq p+q-4$;
- if $d(w, H)=2$ and each vertex in $L^{\prime}-N(w, H)$ is isolated, then we take a vertex $z^{\prime \prime} \in L^{\prime}$ such that $d\left(z^{\prime \prime}, H\right) \geq p / 2$ and an isolated vertex $w^{\prime}$ in $R$.
For $p \geq 5$ let $G^{\prime}=G-\left\{x, x^{\prime \prime}, y\right\}, H^{\prime}=H-\left\{z, z^{\prime \prime}, w^{\prime}\right\}$, where $x^{\prime \prime} \in L$ such that $d\left(x^{\prime \prime}, G\right) \geq 2$. By the induction hypothesis or Remark 1.1, $G^{\prime}$ and $H^{\prime}$ are m.p. Hence $G$ and $H$ are m.p., too. For $p \leq 4$ it is easy to check that either $(G, H)$ are m.p. or $(G, H) \in W_{5}(p, q)$.

Subcase 2.2. For each vertex in $R^{\prime}$ its degree is at most one. Let $z^{\prime} \in L^{\prime}$ and $d\left(z^{\prime}, H\right)=\Delta_{L}(H)=k$. Hence $k \geq 2$. Let us suppose first that $d(x, G)>q-k$, for each vertex $x \in L$. Then we have

$$
\begin{equation*}
p+q-1 \geq e(G) \geq p(q-k+1) \tag{*}
\end{equation*}
$$

and, since $k \leq p$, we have $q-1 \geq p(q-p)$ and we see that $q \leq p+1$. Therefore, and by the unequality ( $*$ ), $p \geq q-1 \geq p(q-k)$ and $k \geq q-1$. Thus $k=p$ and now we may easily deduce that either $(G, H) \in W_{1}(p, q)$, or else $(G, H) \in W_{2}(p, q)$. So from now on we may assume that there is a vertex $x \in L$ such that $d(x, G) \leq q-k$. If $d(x, G)=0$, then $G$ and $H$ are m.p. by Theorem B. If $d(x, G) \geq 1$, then we define the sets $Z$ and $Z^{\prime}$ such that $Z^{\prime}=N\left(z^{\prime}, H\right),\left|Z^{\prime}\right|=k, Z \subseteq R-N(x, G)$ and $|Z|=k$. Let $G^{\prime}=G-\{x\}-Z, H^{\prime}=H-\left\{z^{\prime}\right\}-Z . G^{\prime}$ and $H^{\prime}$ are $(p-1, q-k)$-bipartite graphs and $e\left(G^{\prime}\right) \leq(p-1)+(q-k)-1, e\left(H^{\prime}\right)=p-k$ and there is a biplacement of $G^{\prime}$ and $H^{\prime}$. Hence for $p<q$ we have $p-k<\min \{p-1, q-k\}$ and there is a bi-placement of $G^{\prime}$ and $H^{\prime}$. A bi-placement of $G$ and $H$ is
evident. For $p=q$ each vertex in $R^{\prime}$ is pendent and there are no isolated vertices in $L$. Hence we may use Lemma 2.2.

Theorem 2.4. Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$ bipartite graphs such that $2 \leq p \leq q, e(G) \leq p+q+k-1, e(H) \leq p-k$, where $2 \leq k \leq p$. Then $G$ and $H$ are m.p.

Proof. Let $k$ be an integer such that $k \in\{2, \ldots, p\}$. The proof is by induction on $p+q$. The theorem is easy to check when $p \leq 3$ and $p \leq q$. So let us suppose $p \geq 4, q \geq p$ and the theorem is true for all positive integers $p^{\prime}, q^{\prime}$ such that $p^{\prime}+q^{\prime}<p+q$. Let $H=(L, R ; E)$ and $G=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs verifying the assumptions of the theorem. We may assumme that $e(G)=p+q+k-1$ and $e(H)=p-k$. The theorem is easy to check for $k=p$ or $k=p-1$. Now we suppose that $2 \leq k \leq p-2$. Notice that $\delta_{R}(G) \leq 2$ and let $z_{0}$ be a vertex in $R$ such that $d\left(z_{0}, G\right)=\delta_{R}(G)$. To prove that $G$ and $H$ are m.p. we shall distinguish four cases.

Case 1. The vertex $z_{0}$ is isolated. Let $w \in L$ be such a vertex that $d(w, G) \geq 2, y$ be non isolated in $R^{\prime}$ and $x$ be an isolated in $L^{\prime}$. By the induction hypothesis, there is a bi-placement of $G-\left\{w, z_{0}\right\}$ and $H-\{x, y\}$. A bi-placement of $G$ and $H$ is evident.

Case 2. The vertex $z_{0}$ is pendent and the degree of its neighbor $w$ is at least two. Now choose a vertex $y \in R^{\prime}$ such that $d(y, H) \geq 1$ and an isolated vertex, say $x$, in $L^{\prime}$ and proceed like in the preceding case.

Case 3. There is no isolated vertex in $R$, there are pendent vertices in $R$ and for each vertex in $R$ also its neighbor is pendent. We may choose vertices $\left\{w_{0}, w_{1}, z_{0}, z_{1}\right\}$ of the graph $G$ and vertices $\left\{x_{0}, x_{1}, y_{0}, y_{1}\right\}$ of the graph $H$ in the following way: $w_{0}$ is pendent in $\mathrm{L}, z_{0} \in N\left(w_{0}, G\right), w_{1} \in L$, $z_{1} \in R$ such that $d\left(w_{1}, G\right) \geq 2, d\left(z_{1}, G\right) \geq 2$ and $x_{0}, x_{1} \in L^{\prime}, y_{0}, y_{1} \in R^{\prime}$ such that $d\left(x_{1}, H\right)=d\left(y_{1}, H\right)=0,\left(x_{0} y_{0}\right) \notin E^{\prime}$ and $\left|N\left(x_{0}, H\right) \cup N\left(y_{0}, H\right)\right| \geq 2$. The graphs $G^{\prime}=G-\left\{w_{0}, w_{1}, z_{0}, z_{1}\right\}$ and $H^{\prime}=H-\left\{x_{0}, x_{1}, y_{0}, y_{1}\right\}$ are ( $p-2, q-2$ )-bipartite and, for $k \leq p-2$, verify the induction hypothesis. Hence there is a bi-placement, say $g$, of $G^{\prime}$ and $H^{\prime}$. The bijection $f$ defined by

$$
\begin{aligned}
& f(w)=g(w), \text { for } w \in V\left(G^{\prime}\right) \\
& f\left(w_{i}\right)=x_{i} \\
& f\left(z_{i}\right)=y_{i} i=0,1
\end{aligned}
$$

is a bi-placement of $G$ and $H$.
Case 4. The degree of the vertex $z_{0}$ is two.
a) If there is a vertex, say $y_{0}$, in $R^{\prime}$ such that $d\left(y_{0}, H\right) \geq 2$, then we choose vertices $x, x_{1}$ and $y_{1}$ of the graph $H$ in the following way: $x, x_{1}$ are isolated in $L^{\prime}, y$ is isolated in $R^{\prime}$. Let $w_{1}, w_{2} \in N\left(z_{0}, G\right)$ and $z_{1} \in$ $R-\left\{z_{0}\right\}$. Now we define the graphs $G^{\prime}=G-\left\{z_{0}, z_{1}, w_{1}, w_{2}\right\}$ and $H^{\prime}=H-\left\{y_{1}, y_{0}, x, x_{1}\right\}$ and construct a bi-placement of $G$ and $H$.
b) Now for each vertex in $R^{\prime}$ let its degree is at most one. Let $x$ be a vertex in $L^{\prime}$ such that $d(x, H)=\Delta_{L}(H)$. Hence $d(x, H) \in\{1, \ldots, p-k\}$. There is a vertex $w \in L$ such that $d(w, G)+d(x, H) \leq q$. Otherwise the degree of each vertex in $L$ would be at least

$$
\begin{align*}
& q-d(x, H)+1 \text { and }  \tag{**}\\
& e(G) \geq p(q-p+k+1)
\end{align*}
$$

But, for $p \leq q$ and $2 \leq k \leq p-2$ the unequality ( $* *$ ) cannot hold. If $d(w, G)=0$, then we choose a vertex $z_{0}$, an isolated vertex in $R^{\prime}$, say $y$, and construct a bi-placement of $G$ and $H$ like in Case 1. If $d(w, G)>0$, we define the sets $Z$ and $Z^{\prime}$ and graphs $G^{\prime}$ and $H^{\prime}$ in the following way:

$$
\begin{aligned}
& Z^{\prime}=N(x, H), Z \subseteq R-N(w, G) \text { and }|Z|=d(x, H), \\
& G^{\prime}=G-\{w\}-Z, H^{\prime}=H-\{x\}-Z^{\prime} .
\end{aligned}
$$

$G^{\prime}$ and $H^{\prime}$ are ( $p-1, q-d(x, H)$ )-bipartite graphs such that

$$
\begin{aligned}
& e\left(G^{\prime}\right) \leq p+q+k-1-2 d(x, H) \leq(p-1)+(q-d(x, H))+k-1 \\
& e\left(H^{\prime}\right) \leq p-k-d(x, H) \leq \min \{p-1-k, q-k-d(x, H)\} .
\end{aligned}
$$

Hence $G^{\prime}$ and $H^{\prime}$ are m.p. A bi-placement of $G$ and $H$ is evident.
Proof of Theorem 1. Theorem 1 is a consequence of Theorem B, Remark 1.1, Theorem 1.3 and Theorem 2.4.
