# 2-PLACEMENT OF $(p, q)$-TREES 

Beata Orchel<br>University of Mining and Metallurgy<br>Al. Mickiewicza 30<br>30-059 Kraków, Poland

#### Abstract

Let $G=(L, R ; E)$ be a bipartite graph such that $V(G)=L \cup R$, $|L|=p$ and $|R|=q . \quad G$ is called $(p, q)$-tree if $G$ is connected and $|E(G)|=p+q-1$.

Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-tree. A bijection $f: L \cup R \rightarrow L^{\prime} \cup R^{\prime}$ is said to be a biplacement of $G$ and $H$ if $f(L)=L^{\prime}$ and $f(x) f(y) \notin E^{\prime}$ for every edge $x y$ of $G$. A biplacement of $G$ and its copy is called 2-placement of $G$. A bipartite graph $G$ is 2-placeable if $G$ has a 2-placement. In this paper we give all $(p, q)$-trees which are not 2-placeable.

Keywords: tree, bipartite graph, packing graph.
2000 Mathematics Subject Classification: 05C35.

## 1. Definitions

We shall use standard graph theory notation. All graphs will be assumed to have neither loops nor multiple edges. Let $G=(L, R ; E)$ be a bipartite graph with a vertex set $V(G)=L \cup R$, where $L \cap R=\varnothing L(G)=L$, $R(G)=R$ are left and right set of bipartition of the vertex set, an edge set $E(G)=E$ and size $e(G)$. For a vertex $x \in V(G)$ by $N(x, G)$ and $d(x, G)$ we denote the set of its neighbors in $G$ and the degree of the vertex $x$ in $G$, respectively. $\Delta_{L}(G)$ and $\Delta_{R}(G)$ are the maximum vertex degree in the set $L(G)$ and $R(G)$, respectively. By $P_{n}$ we denote the path of length $n-1$. Bipartite graph $G=(L, R ; E)$ is said $(p, q)$-bipartite if $|L|=p$ and $|R|=q . K_{p, q}$ is the complete $(p, q)$-bipartite graph. $\bar{G}$ is the complement of
$G$ in $K_{p, q}$. A bipartite graph $G=(L, R ; E)$ is a subgraph of bipartite graph $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ if $L \subseteq L^{\prime}, R \subseteq R^{\prime}$ and $E \subseteq E^{\prime}$.

Let $G=(L, R ; E)$ and $H=\left(L^{\prime}, R^{\prime} ; E^{\prime}\right)$ be two $(p, q)$-bipartite graphs. We say that $G$ and $H$ are mutually placeable (for short $m p$ ) if there is a bijection $f: L \cup R \rightarrow L^{\prime} \cup R^{\prime}$ such that $f(L)=L^{\prime}$ and $f(x) f(y)$ is not edge in $H$ whenever $x y$ is an edge of $G$. The function $f$ is called the biplacement of $G$ and $H$. Thus $G$ and $H$ are $m p$ if and only if $G$ is contained in the graph $\bar{H}$, i.e., $G$ is subgraph of $\bar{H} .2$-placement of $G$ is a biplacement of $G$ and its copy. If such a 2 -placement of $G$ exists then we say that $G$ is 2-placeable.

In the proof of the main theorem of this paper we use the adjacency matrices defined as follows.

Let $G=(L, R ; E)$ be a $(p, q)$-bipartite graph, $L=\left\{x_{1}, \ldots, x_{p}\right\}$ and $R=\left\{y_{1}, \ldots, y_{q}\right\}$. The matrix $M_{G}=\left(a_{i j}\right)_{\substack{i=1, \ldots, p \\ j=1, \ldots, q}}$ where:

$$
a_{i j}= \begin{cases}1, & x_{i} x_{j} \in E(G) \\ 0, & x_{i} x_{j} \notin E(G)\end{cases}
$$

is called adjacency matrix of the graph $G$. Let $G$ and $H$ be mutually placeable $(p, q)$-bipartite graphs and let $f$ be a biplacement of $G$ and $H$. We may define the new $p \times q$ matrix $M_{G, H}=\left(b_{i, j}\right)$ by the formula

$$
b_{i j}= \begin{cases}1, & \text { when } x_{i} x_{j} \in E(H) \\ 2, & \text { when } x_{i} x_{j} \in E(f(G)) \\ 0, & \text { when } x_{i} x_{j} \notin E(H) \text { and } x_{i} x_{j} \notin E(f(G))\end{cases}
$$

The matrix $M_{G, H}$ is said to be the matrix of biplacement of $G$ and $H$. Next, instead of looking for biplacement of $G$ and $H$ we shall look for a matrix $M_{G, H}$.

A $(p, q)$-bipartite graph $G$ is called $(p, q)$-tree if $G$ is connected and $|E(G)|=p+q-1$. Thus each $(p, q)$-tree is a tree and for each tree $T$ there exist integers $p$ and $q$ such that $T$ is $(p, q)$-tree.

Let $T$ be a $(p, q)$-tree and $y \in V(T)$. Let us denote by $U_{y}$ the set of all $z \in N(y, T)$ such that $d(z, T)=1$. We shall call $U_{y}$ the bough with the center $y$. We say that $\{x, y\} \subset L$ (or $\{x, y\} \subset R$ ) is a good pair of vertices (for short good pair) if there exist vertices $w$ and $z$ such, that $x \in U_{w}, y \in U_{z}$ and $w \neq z$.

## 2. Results

Let $G$ be a general graph of order $n$. The following theorem has been proved in [2].

Theorem 1. If $e(G) \leq n-1$ and $n \geq 8$ then either $G$ is contained in $\bar{G}$ or $G$ is isomorphic to one of the following graphs: $K_{1, n-1}, K_{1, n-4} \cup K_{3}$.

Wang and Saver proved the following result in [6].

Theorem 2. A tree of order $n \geq 7$ is not 3-placeable if and only if it is isomorphic to the star $S_{n}$ or the graph obtained from $S_{n-1}$ by inserting a new vertex into an edge of $S_{n-1}$.

Makheo, Saclé and Woźniak in [4] characterized all triples of trees $\left\{T_{n}, T_{n}^{\prime}\right.$, $\left.T_{n}^{\prime \prime}\right\}$ which are not mutually placeable in $K_{n}$.

For bipartite graphs, J.L. Fouquet and A.P. Wojda in [3] characterized those $(p, q)$-bipartite graphs of size $p+q-2$ which are not 2-placeable in $K_{p, q}$.

All pairs of $(p, q)$-bipartite graphs $G, H$ which are not placeable, $e(G) \leq$ $p+q-1, e(H) \leq p$ and $p \leq q$ are given in [5].

The main result to be presented in this paper is that any $(p, q)$-tree $T$ such that $\Delta_{R}(T)<p, \Delta_{L}(T)<q, p \geq 3, q \geq 3$ and $p+q \geq 7$ is either 2-placeable or $T$ is in the family $\mathcal{T}(p, q)$ of graphs which are defined below:
$T^{\prime} L(p, q, k)$ is the $(p, q)$-tree $T$ such that, there are three vertices $v, w$, $w^{\prime}$ such that $v \in L$ and $d(v, T)=q-1, w^{\prime} \in R \backslash N(v, T), d\left(w^{\prime}, T\right)=k$, $w \in N(v, T)$ and $d(w, T)=p-k+1$ (see Figure 1). We shall called the vertex $v$ the left center of $T$.

It is not difficult to see that $T^{\prime} L(p, q, k)$ is 2-placeable if and only if $1<k \leq \frac{p}{2}$. Let $\mathcal{T} L(p, q)=\bigcup\left\{T^{\prime} L(p, q, k) ; k>\frac{p}{2}\right\}$. Analogically we define the tree $T^{\prime} R(p, q, k)$ and the set $\mathcal{T} R(p, q)=\left\{T^{\prime} R(p, q, k) ; k>\frac{q}{2}\right\}$. The tree $T^{\prime} R(p, q, k)$ is shown in Figure 2.

By $\mathcal{T}(p, q)$ we denote the set $\mathcal{T} R(p, q) \cup \mathcal{T} L(p, q)$.
Now, we can formulate our main result.

Theorem A. Let $T=(L, R ; E)$ be a $(p, q)$-tree such that $\Delta_{L}(T)<q$, $\Delta_{R}(T)<p, p \geq 3, q \geq 3$ and $p+q \geq 7$. Then either $T$ is 2-placeable or $T \in \mathcal{T}(p, q)$.

Figure 2

## 3. Proof of Theorem A

To prove Theorem A we shall need two lemmas and some observations.
Lemma 3.1. Let $T=(L, R ; E)$ be $a(p, q)$-tree such that there are two different vertices $y$ and $y^{\prime}$ such that either $y, y^{\prime} \in L$ or $y, y^{\prime} \in R, U_{y} \neq \varnothing$ and $U_{y^{\prime}} \neq \varnothing$. Let $\left|U_{y}\right|=k, U_{y}=\left\{x_{1}, \ldots, x_{k}\right\},\left|U_{y^{\prime}}\right|=k^{\prime}, U_{y^{\prime}}=\left\{x_{1}^{\prime}, \ldots, x_{k^{\prime}}^{\prime}\right\}$, and $k \leq k^{\prime}$. Denote by $U_{y^{\prime}}^{*}$ the set $\left\{x_{1}^{\prime}, \ldots, x_{k}^{\prime}\right\}$.

If $T \backslash\left(U_{y} \cup U_{y^{\prime}}^{*}\right)$ is 2-placeable, then $T$ is 2-placeable, too.
Proof. Let $T^{\prime}=T \backslash\left(U_{y} \cup U_{y^{\prime}}^{*}\right)$ and let $f$ be a 2-placement of $T^{\prime}$. We may define a 2-placement $f^{*}$ of $T$ in the following way:

- $f^{*}(v)=f(v)$, for each vertex $v$ of $T^{\prime}$,
- if $f\left(y^{\prime}\right)=y^{\prime}$ or $f(y)=y$ then $f^{*}\left(U_{y}\right)=U_{y^{\prime}}^{*}, f^{*}\left(U_{y^{\prime}}^{*}\right)=U_{y}$,
- if $f\left(y^{\prime}\right) \neq y^{\prime}$ and $f(y) \neq y$ then $f^{*}\left(U_{y}\right)=U_{y}, f^{*}\left(U_{y^{\prime}}^{*}\right)=U_{y^{\prime}}^{*}$.

Lemma 3.2. Let $T=(L, R ; E)$ be $(3, q)$-tree, $\Delta_{L}(T)<q, \Delta_{R}(T)<3$ and $q \geq 4$. Then $T$ is 2-placeable unless $T \in \mathcal{T}(3, q)$.

Proof. Let $T=(L, R ; E)$ be a $(3, q)$-tree, $\Delta_{L}(T)<q$ and $\Delta_{R}(T)<3$. Let $L=\{a, b, c\}, d(a, T)=k_{1}, d(b, T)=k_{2}$ and $d(c, T)=k_{3}$. Note that two of sets $N(a, T) \cap N(b, T), N(b, T) \cap N(c, T), N(c, T) \cap N(a, T)$ are 1-sets, while the third is empty. We assume that $N(a, T) \cap N(b, T) \neq N(b, T) \cap N(c, T)$, otherwise $\Delta_{R}(T)=3$. Let $z$ be a common neighbor of vertices $a$ and $b$, and let $y$ be a common neighbor of vertices $b$ and $c$. Let $N(a, T)=$ $\left\{x_{1}, \ldots, x_{k_{1}}\right\}, x_{k_{1}}=z, N(b, T)=\left\{x_{k_{1}}, \ldots, x_{k_{1}+k_{2}-1}\right\}, x_{k_{1}+k_{2}-1}=y$ and $N(c, T)=\left\{x_{k_{1}+k_{2}-1}, \ldots, x_{q}\right\}$. The tree $T$ and the matrix $M_{T}$ is shown in Figure 3.

Observe that $k_{1} \geq 1, k_{3} \geq 1, k_{2} \geq 2$ and $k_{1}+k_{2}+k_{3}-2=q$. If $k_{1}=1$ and $k_{3}>\frac{q}{2}$ or $k_{3}=1$ and $k_{1}>\frac{q}{2}$ then $T \in \mathcal{T}(3, q)$. If $k_{1}=1$ and $k_{3} \leq \frac{q}{2}$ then any function $f: L \cup R \rightarrow L \cup R$ such that $f(N(b, T))=\left\{x_{q-k_{2}+1}, \ldots, x_{q}\right\}$ and $f(N(c, T))=\left\{x_{1}, \ldots, x_{q-k_{2}+1}\right\}, f(b)=a, f(a)=b, f(c)=c$ is 2-placement of $T$. For $k_{3}=1$ and $k_{1} \leq \frac{q}{2}$ we define a 2 -placement of $T$ analogically.

So, we assume that for each $i \in\{1,2,3\} k_{i} \geq 2$. Let $k=\max \left\{k_{1}, k_{2}, k_{3}\right\}$. We consider two cases.

Case 1. $k \neq k_{2}$
We may assume that $k=k_{3}$. The function $f$ such that $f(c)=a, f(b)=b$, $f(c)=a, f(N(a, T))=\left\{x_{1}, \ldots, x_{k}\right\}, f(N(b, T))=\left\{x_{1}, x_{k_{1}+k_{3}}, \ldots, x_{q}\right\}$ and
$f(N(c, T))=\left\{x_{k_{1}+1}, \ldots, x_{k_{1}+k_{3}-1}, x_{q}\right\}$ is a 2-placement of $T$. For $k_{1}=4$, $k_{2}=4$ and $k_{3}=6$ the matrix $M_{T, T}$ is shown in the Figure 4.

Figure 3
$x_{1}$

$c$$\left[\begin{array}{llllllllllll}1 & 1 & 1 & 1 & 2 & 2 & 2 & 2 & 2 & 0 & 0 & 2 \\ 2 & 0 & 0 & 1 & 1 & 1 & 1 & 0 & 0 & 2 & 2 & 2 \\ 2 & 2 & 2 & 2 & 0 & 0 & 1 & 1 & 1 & 1 & 1 & 1\end{array}\right]$

Figure 4
Case 2. $k=k_{2}$
Without loss of the generality, we may suppose that $k_{1} \leq k_{3}<k_{2}$. The 2-placement of $T$ we may define as follows: $f(a)=b, f(b)=a, f(c)=c$, $f(N(b, T))=\left\{x_{q-k_{2}+1}, \ldots, x_{q}\right\}, f(N(a, T))=\left\{x_{1}, \ldots, x_{k_{1}-1}, x_{q}\right\}$, $f(N(c, T))=\left\{x_{k_{1}}, \ldots, x_{q-k_{2}+1}\right\}$. The matrix of $M_{T, T}$ when $k_{1}=4, k_{2}=6$ and $k_{3}=5$ is shown in Figure 5 .

Figure 5
Let $T$ be $(p, q)$-tree, such that $\Delta_{R}(T)<p \Delta_{L}(T)<q, 5 \leq p \leq q$ and $6 \leq q$. Let $\{x, y\}$ be a good pair of vertices. We say that $\{x, y\}$ is a very good pair if either $\Delta_{L}(T \backslash\{x, y\})<q-2$ and $T \backslash\{x, y\} \notin \mathcal{T}(p, q-2)$ when $\{x, y\} \subset R$ or $\Delta_{R}(T \backslash\{x, y\})<p-2$ and $T \backslash\{x, y\} \notin \mathcal{T}(p-2, q)$ when $\{x, y\} \subset L$.

## Observations.

1. If $T \in \mathcal{T}(p, q)$ then if $v$ is the left (or right) center of $T$, then there is exactly one vertex which is not pendent in $N(v, T)$.
2. If $T \in \mathcal{T}(p, q)$ and $z$ is the common neighbor of the vertices $w$ and $w^{\prime}$ then $d(z, T)=2$.

Proof of Theorem A. We shall give the main idea of the proof, leaving to reader long but easy verification of some details. The proof is by induction on $p+q$.

Without the loss of the generality we may assume that $p \leq q$. By Lemma 3.2 the theorem holds if $p=3$ and $q \geq 4$. So, we assume that $p \geq 4$, $q \geq p$ and the theorem is true for every $\left(p^{\prime}, q^{\prime}\right)$-tree if $p^{\prime}+q^{\prime}<p+q$.

Let $T$ be a $(p, q)$-tree verifying assumptions of the theorem. Then there is a pendent vertex in $R$.

To prove that $T$ is 2-placeable unless $T \in \mathcal{T}(p, q)$ we shall distinguish two cases.

Case 1. There are two pendent vertices in $R$, say $x$ and $y$, having different neighbors - $\{x, y\}$ is a good pair in $R$. When $q=4$ then the theorem is easy to check. So, we may assume that $q \geq 5$.

Let $T^{\prime}=T \backslash\{x, y\}$. If $\{x, y\}$ is a very good pair, then by the induction hypothesis $T^{\prime}$ is 2 -placeable. The 2-placement of $T$ we have by the Lemma 3.1. Now, we suppose that $\{x, y\}$ is not a very good pair. We consider three subcases.

Figure 6
Subcase 1.1. $\Delta_{L}\left(T^{\prime}\right)=q-2$
Let $v$ be a vertex in $L$ such that $d\left(v, T^{\prime}\right)=q-2$. First, we assume that $d(v, T)=q-2$. Let $N(x)=\{z\}$ and $N(y)=\left\{z^{\prime}\right\}$ (see Figure 6). Observe that if $p \leq q-2$ then there is a pendent vertex, say $x^{\prime}$, in the set $N(v, T)$ and $\left\{x, x^{\prime}\right\}$ is a very good pair in $R$. In fact, if $T^{\prime \prime}=T \backslash\left\{x, x^{\prime}\right\}$ then $\Delta_{L}\left(T^{\prime \prime}\right)=q-3<q-2$ and $\Delta_{R}\left(T^{\prime \prime}\right)=\Delta_{R}(T)<p$. Suppose that $T^{\prime \prime} \in$ $\mathcal{T} L(p, q-2)$. Then the only possible center is the vertex $v$. But then $R\left(T^{\prime \prime}\right) \backslash N\left(v, T^{\prime \prime}\right)=\{y\}$ and $d\left(y, T^{\prime \prime}\right)=1$, a contradiction.

Now, we suppose that $p=q \geq 6$ or $p=q-1 \geq 5$ and each neighbor of the vertex $v$ has the degree at least two. In this case either $T=T_{1}$ or $T=T_{2}$ else $T=T_{3}$ where $T_{1}, T_{2}$ and $T_{3}$ are the graphs defined in the Figure 7 .

Note that there is a very good pair of vertices in $L$. Let $\left\{x^{\prime}, y^{\prime}\right\}$ be a very good pair in $L$. By induction hypothesis $T \backslash\left\{x^{\prime}, y^{\prime}\right\}$ has 2-placement. $T$ is 2-placeable by the Lemma 3.1.

When $p=q=5$ and there are no very good pairs in $L$ and each neighbour of the vertex $v$ has the degree at least two or if $p=4$ the proof may be completed by checking all possible cases.

Figure 7

Let us suppose now, that $d(v, T)=q-1$ and $y \notin N(v, T)$ (see Figure 8).
If there is a 2-placement $f$ of $T \backslash\{x\}$ then $f(v) \neq\{v\}$ and the map defined by $f^{*}\left(z^{\prime}\right)=f\left(z^{\prime}\right)$, for $z^{\prime} \neq x, f^{*}(x)=x$ is 2-placement of $T$.

Observe that $T \backslash\{x\}$ is $(p, q-1)$-tree, $\Delta_{L}(T \backslash\{x\})=q-2<q-1$ and $\Delta_{R}(T \backslash\{x\})=\Delta_{R}(T)<p$. There are at least two vertices of the degree at least two in the set $N(v, T)$. In the other case $\Delta_{R}(T)=p$. Therefore, by Observation $1, T \backslash\{x\} \notin \mathcal{T} L(p, q-1)$. If there is a vertex of degree $p-1$ in $N(v, T) \backslash\left\{y_{1}\right\}$, where $\left\{y_{1}\right\}=N(v, T) \cap N(z, T)$, then $T \backslash\{x\} \in \mathcal{T} R(p, q-1)$.

But the degree of the vertex $z$, which is not adjacent to the right center of $T$, is two. Hence we conclude that $T \backslash\{x\} \notin \mathcal{T} R(p, q-1)$ and, by the induction hypothesis, there is a 2 -placement $f$ of $T \backslash\{x\}$.

Figure 8

Subcase 1.2. $T^{\prime} \in \mathcal{T} R(p, q-2)$
First we assume that $d\left(w, T^{\prime}\right) \geq 3$. Then either $T=T_{1}$, or $T=T_{2}$, or $T=T_{3}$, else $T=T_{4}$ (see Figure 9 )

Let $T=T_{1}$ and let $x^{\prime}$ be a pendent neighbor of the vertex $w^{\prime}$. The tree $T \backslash\left\{x^{\prime}, y\right\}$ has two neighbors of vertex $v$ of degree at least two. Hence, by Observation $1, T \backslash\left\{x^{\prime}, y\right\} \notin \mathcal{T}(p, q-2)$ and $\left\{x^{\prime}, y\right\}$ is very good pair.

Analogically, we may show that $\left\{x^{\prime}, y\right\}$ is a very good pair if $T=T_{2}$ and $x^{\prime}$ is pendent in $N\left(w^{\prime}\right)$ or if $T=T_{3}, x^{\prime} \in N(w)$ and $d\left(x^{\prime}, T\right)=1$. When $T=T_{4}$ then $T \in \mathcal{T} R(p, q)$.

If $d\left(w, T^{\prime}\right)=2$ and $T=T_{3}$ then there is no very good pair in $V(T)$. Let then the tree $T=T_{3^{\prime}}$. The matrix $M_{T_{3}^{\prime}, T_{3}^{\prime}}$ is shown in Figure 10.

Subcase 1.3. $T^{\prime} \in \mathcal{T} L(p, q-2)$
At the beginning we assume that $d\left(w^{\prime}, T^{\prime}\right)=p-1$. In this case either there are very good pair in $R$ or $T \in \mathcal{T} R(p, q)$ else $T=T_{3}^{\prime}$ (See Figure 10).

For $d\left(w^{\prime}, T^{\prime}\right)=p-2$, unless $T=T_{5}$ or $T=T_{6}$ (See Figure 11), there is a very good pair of vertices in $T^{\prime}$. The matrices $M_{T_{5}, T_{5}}$ and $M_{T_{6}, T_{6}}$ are not difficult to find.

If $d\left(w^{\prime}, T\right) \leq p-3$ then there is very good pair of vertices $V(T)$.

Case 2. There is a vertex in $L$, say $z_{0}$, such that each pendent vertex in $R$ is its neighbor.
$T_{1}$

$T_{2}$

$T_{3}$

$T_{4}$

Figure 9

Figure 10

Figure 11

Let us denote by $U_{z_{0}}$ the bough with center $z_{0}$ and let $\left|U_{z_{0}}\right|=m$. Note that $d\left(z_{0}, T\right) \geq m$. If $d\left(z_{0}, T\right)=m$ then $m=q$ and $T=K_{1, q}$. So, we suppose now, that $d\left(z_{0}, T\right) \geq m+1$. Observe, that there is at least one pendent vertex in $L$. In the other case there is a good pair of the vertices in $R$.

First, we assume that there is a good pair, say $x^{\prime}$ and $y^{\prime}$, in $L$. When $p=4$ then $m=q-2$ or $m=q-3$ and is easy to check the theorem.

For $p \geq 5 T^{\prime \prime}=T \backslash\left\{x^{\prime}, y^{\prime}\right\}$ is $(p-2, q)$-tree, $(p-2 \geq 3)$ and if $\left\{x^{\prime}, y^{\prime}\right\}$ is very good pair then $T^{\prime \prime}$ is 2-placeable by the induction hypothesis. $T$ has 2-placement by Lemma 3.1.

Now, we suppose that there is no very good pair in $L$ - i.e., $\left\{x^{\prime}, y^{\prime}\right\}$ is a good pair but either $\Delta_{R}\left(T^{\prime \prime}\right)=p-2$ or $T^{\prime \prime} \in \mathcal{T}(p-2, q)$. Observe that $\Delta_{R}\left(T^{\prime \prime}\right)<p-2$. In the other case either $\Delta_{L}(T)=q$ or there is a cycle $C_{4}$ in $T$.

$z_{0}$

Figure 12

If $T^{\prime \prime} \in \mathcal{T} R(p-2, q)$ or $T^{\prime \prime} \in \mathcal{T} L(p-2, q)$, then either $T \in \mathcal{T} L(p, q)$ or $T=T_{3^{\prime}}$.

Finally, we assume that all pendent vertices in $L$ have a common neighbor. Let $x_{0}$ be a vertex in $R$ such that if $v^{\prime} \in L$ and $d\left(v^{\prime}, T\right)=1$ then $v^{\prime} \in N\left(x_{0}\right)$ and let $\left|U_{x_{0}}\right|=l$. Observe, that $T^{\prime \prime \prime}=T \backslash U_{z_{0}} \backslash U_{x_{0}}=P_{2 n}$, where $n=q-m=p-l$. When $n=1$ then $\Delta_{L}(T)=q$. If $n=2$ then $T \in \mathcal{T} L(p, q)$. For $n \geq 3$ the tree $T=T_{10}$ and the matrix $M_{T_{10}, T_{10}}$ shown in Figure 12.
This completes the proof of the theorem.
