# MINIMAL CYCLE BASES OF THE LEXICOGRAPHIC PRODUCT OF GRAPHS 

M.M.M. Jaradat<br>Department of Mathematics<br>Yarmouk University<br>Irbid-Jordan<br>e-mail: mmjst4@yu.edu.jo

#### Abstract

A construction of minimum cycle bases of the lexicographic product of graphs is presented. Moreover, the length of a longest cycle of a minimal cycle basis is determined.

Keywords: cycle space, lexicographic product, cycle basis.
2000 Mathematics Subject Classification: 05C38, 05C75, 05B35.

## 1. Introduction

Minimum cycle bases (MCBs) of a cycle spaces have a variety of applications in sciences and engineering, for example, in structural flexibility analysis, electrical networks and in chemical structure storage and retrieval systems (see $[6,7]$ and $[14]$ ).

In general, the total length $l(G)$ of a minimum cycle basis and the length of the longest cycle in a minimum cycle basis $\lambda(G)$ are not minor monotone (see [11]). Hence, there does not seem to be a general way of extending minimum cycle bases of a certain collection of partial graphs of $G$ to a minimum cycle basis of $G$. Global upper bound $l(G) \leq \operatorname{dim} \mathcal{C}(G)+\kappa(T(G))$ where $\kappa(T(G))$ is the connectivity of the tree graph of $G$ is proven in [16].

In this paper, we construct a minimum cycle basis for the lexicographic product of two graphs in term of a minimum cycle basis of the second factor, also, we give its total length and the length of its longest cycle.

## 2. Definitions and Preliminaries

The graphs considered in this paper are finite, undirected, simple and connected. Most of the notations that follow can be found in [10]. For a given graph $G$, we denote the vertex set of $G$ by $V(G)$ and the edge set by $E(G)$.

### 2.1. Cycle bases

Given graph $G$. The set $\mathcal{E}$ of all subsets of $E(G)$ forms an $|E(G)|$-dimensional vector space over $Z_{2}$ with vector addition $X \oplus Y=(X \backslash Y) \cup(Y \backslash X)$ and scalar multiplication $1 \cdot X=X$ and $0 \cdot X=\varnothing$ for all $X, Y \in \mathcal{E}$. The cycle space, $\mathcal{C}(G)$, of a graph $G$ is the vector subspace of $(\mathcal{E}, \oplus,$.$) spanned by the$ cycles of $G$ (see [11]). Note that the non-zero elements of $\mathcal{C}(G)$ are cycles and edge disjoint union of cycles. It is known that the dimension of the cycle space is the cyclomatic number or the first Betti number (see [4])

$$
\begin{equation*}
\operatorname{dim} \mathcal{C}(G)=|E(G)|-|V(G)|+1 \tag{1}
\end{equation*}
$$

A basis $\mathcal{B}$ for $\mathcal{C}(G)$ is called a cycle basis of $G$. The length, $|C|$, of the element $C$ of the cycle space $\mathcal{C}(G)$ is the number of its edges. The length $l(\mathcal{B})$ of a cycles basis $\mathcal{B}$ is the sum of the lengths of its elements: $l(\mathcal{B})=\sum_{C \in \mathcal{B}}|C|$. $\lambda(G)$ is defined to be the minimum length of the longest element in an arbitrary cycle basis of $G$. A minimum cycle basis (MCB) is a cycle basis with minimum length. With $l(G)$ we denote to the sum of the lengths of the cycles in a minimum cycle basis. Since the cycle space $\mathcal{C}(G)$ is a matroid in which an element $C$ has weight $|C|$, the greedy algorithm can be used to extract a MCB (see [19]). A cycle is relevant if it is contained in some MCB (see [18]).

Proposition 2.1.1 (Plotkin [17]). A cycle $C$ is relevant if and only if it cannot be written as a linear combinations modulo 2 of shorter cycles.

Chickering, Geiger and Heckerman [5], showed that $\lambda(G)$ is the length of the longest element in a MCB.

### 2.2. Products

Let $G=(V(G), E(G))$ and $H=(V(H), E(H))$ be two graphs.
(1) The Cartesian product $G \square H$ has the vertex set $V(G \square H)=V(G) \times$ $V(H)$ and the edge set $E(G \square H)=\left\{\left(u_{1}, v_{1}\right)\left(u_{2}, v_{2}\right) \mid u_{1} u_{2} \in E(G)\right.$ and $v_{1}=$ $v_{2}$, or $v_{1} v_{2} \in E(H)$ and $\left.u_{1}=u_{2}\right\}$.
(2) The strong product $G \boxtimes H$ is the graph with the vertex set $V(G \boxtimes H)=$ $V(G) \times V(H)$ and the edge set $E(G \boxtimes H)=\left\{\left(u_{1}, u_{2}\right)\left(v_{1}, v_{2}\right) \mid u_{1} v_{1} \in E(G)\right.$ and $u_{2} v_{2} \in E(H)$, or $u_{1}=v_{1}$ and $u_{2} v_{2} \in E(H)$, or $u_{1} v_{1} \in E(G)$ and $\left.u_{2}=v_{2}\right\}$.
(3) The lexicographic product $G[H]$ is the graph with vertex set $V(G[H])$ $=V(G) \times V(H)$ and the edge set $E(G[H])=\left\{\left(u_{1}, u_{2}\right)\left(v_{1}, v_{2}\right) \mid u_{1}=v_{1}\right.$ and $u_{2} v_{2} \in E(H)$, or $\left.u_{1} v_{1} \in E(G)\right\}$.
(4) The wreath product $G \ltimes H$ has the vertex set $V(G \ltimes H)=V(G) \times$ $V(H)$ and the edge set $E(G \ltimes H)=\left\{\left(u_{1}, v_{1}\right)\left(u_{2}, v_{2}\right) \mid u_{1}=u_{2}\right.$ and $v_{1} v_{2} \in$ $E(H)$, or $u_{1} u_{2} \in G$ and there is $\alpha \in \operatorname{Aut}(H)$ such that $\left.\alpha\left(v_{1}\right)=v_{2}\right\}$.
(5) The direct product $G \times H$ is the graph with the vertex set $V(G \times H)=$ $V(G) \times V(H)$ and the edge set $E(G \times H)=\left\{\left(u_{1}, u_{2}\right)\left(v_{1}, v_{2}\right) \mid u_{1} v_{1} \in E(G)\right.$ and $\left.u_{2} v_{2} \in E(H)\right\}$.

The $H$-fiber $a \square H$ is the subgraph of a product induced with the vertex set $V(u \square H)=\{(a, v) \mid v \in V(H)\}$. Analogue is defined the $G$-fiber $G \square v$. Let $e \in E(G)$. Then $e[H]$ is called a fold of $G[H]$ (See [1] and [10]). From (1) and by knowing that $|E(G[H])|=|E(G)||V(H)|^{2}+|E(H)||V(G)|$, we have that
(2) $\quad \operatorname{dim} \mathcal{C}(G[H])=|E(G)||V(H)|^{2}+|E(H)||V(G)|-|V(G)||V(H)|+1$

Imrich and Stadler [11] presented a minimum cycle bases of Cartesian product and strong product. They proved the following results:

Theorem 2.2.1. If $G$ and $H$ are triangle free, then $l(G \square H)=l(G)+$ $l(H)+4[|E(G)|(|V(H)|-1)+|E(H)|(|V(G)|-1)-(|V(H)|-1)(|V(G)|-1)]$ and $\lambda(G \square H)=\max \{4, \lambda(G), \lambda(H)\}$.

Theorem 2.2.2. For any two graphs $G$ and $H, l(G \boxtimes H)=l(G)+l(H)+3$ $[\operatorname{dim} C(G \boxtimes H)-\operatorname{dim} C(G)-\operatorname{dim} C(H)]$ and $\lambda(G \boxtimes H)=\max \{3, \lambda(G), \lambda(H)\}$.

Hammack [8] gave a minimal cycle basis of the direct product of two bipartite graphs in term of the minimum cycle bases of the factors. Also, Hammack [9] and Bradshaw and Jaradat [3] presented a minimal cycle bases of the direct product of complete graphs.

In [12] minimum cycle bases of the wreath product have been constructed for some classes of graphs and determined their length and the length of their longest cycles.

The results cited above trigger off the following question: Can we construct a minimum cycle basis for the lexicographic product of graphs? In this paper we will answer this question in affirmative.

After this manuscript was completed the author learned that a similar statement to our main result was proven by Berger in her PhD dissertation [2] and Kaveh and Mirzaie [15].

## 3. Lexicographic Product

In this section, we construct a minimum cycle basis and determine the length of a minimum cycle basis and the minimum length of the longest cycle in an arbitrary cycle basis of the lexicographic product of two graphs. For any edges $a b, u v$ and a vertex $w$, we set the following cycles:

$$
\mathcal{P}_{a b, w}^{u v}=(a, w)(b, u)(b, v)(a, w) .
$$

Also, for a graph $H$ with $E(H)=\left\{u_{1} v_{1}, u_{2} v_{2}, \ldots, u_{|E(H)|} v_{|E(H)|}\right\}$, we let

$$
\mathcal{P}_{a b, w}^{H}=\bigcup_{i=1}^{|E(H)|} \mathcal{P}_{a b, w}^{u_{i} v_{i}} .
$$

Lemma 3.1. For any tree $T$ with $w \in V(T)$ and any edge ab, $\mathcal{P}_{a b, w}^{T}$ is linearly independent. Moreover, any linear combination of $\mathcal{P}_{\text {ab,w }}^{T}$ contains an edge of the form $(a, w)(b, u)$ for some vertex $u \in V(T)$.

Proof. Note that $\mathcal{P}_{a b, w}^{T}=\cup_{i=1}^{|E(T)|} \mathcal{P}_{a b, w}^{u_{i} v_{i}}$. The first part follows from noting that each cycle $\mathcal{P}_{a b, w}^{u_{i} v_{i}}$ contains the edge $b \times u_{i} v_{i}$ which occurs in no other cycle of $\mathcal{P}_{a b, w}^{T}$. The second part follows from being that $E\left(\mathcal{P}_{a b, w}^{T}\right)=$ $\{(a, w)(b, u) \mid u \in V(T)\} \cup E(b \square T)$, and noting that $E(b \square T)$ is an edge set of a tree and any linear combination of cycles is a cycle or an edge disjoint union of cycles.

The following result from [13] will be needed in the forthcoming results:
Proposition 3.2. Let $A, B$ be sets of cycles of a graph $G$, and suppose that both $A$ and $B$ are linearly independent, and $E(A) \cap E(B)$ induces a forest in $G$ (we allow the possibility that $E(A) \cap E(B)=\varnothing$ ). Then $A \cup B$ is linearly independent.

Lemma 3.3. Let $T$ be a tree of order greater than or equal to 2 and ab be an edge. Then $\mathcal{P}_{a b}^{T}=\left(\cup_{w \in V(T)} \mathcal{P}_{a b, w}^{T}\right) \cup \mathcal{P}_{b a, w_{0}}^{T}$ is a linearly independent set of cycles for some fixed vertex $w_{0} \in V(T)$.

Proof. Since $\mathcal{P}_{a b, w}^{T}$ is linearly independent for each $w \in V(T)$ by Lemma 3.1 and since $E\left(\mathcal{P}_{a b, w}^{T}\right) \cap E\left(\mathcal{P}_{a b, v}^{T}\right)=E(b \times T)$ whenever $w \neq v$ which is a tree, as a result by Proposition $3.2 \cup_{w \in V(T)} \mathcal{P}_{a b, w}^{T}$ is linearly independent. Also, since

$$
E\left(\cup_{w \in V(T)} \mathcal{P}_{a b, w}^{T}\right) \cap E\left(\mathcal{P}_{b a, w_{0}}^{T}\right)=\left\{(a, w)\left(b, w_{0}\right) \mid w \in V(T)\right\}
$$

which is an edge set of a star, we have $\mathcal{P}_{a b}^{T}$ is linearly independent by Proposition 3.2.

Now, let $G$ be a graph with $E(G)=\left\{a_{1} b_{1}, a_{2} b_{2}, \ldots, a_{|E(G)|} b_{|E(G)|}\right\}$. Also, let

$$
\mathcal{P}_{G}^{T}=\bigcup_{i=1}^{|E(G)|} \mathcal{P}_{a_{i} b_{i}}^{T}
$$

Lemma 3.4. Let $G$ be any graph and $T$ be a tree. Then $\mathcal{P}_{G}^{T}$ is a linearly independent set.

Proof. We use mathematical induction on $|E(G)|$. If $G$ consists only of one edge, say $G=a_{1} b_{1}$, then $\mathcal{P}_{G}^{T}=\mathcal{P}_{a_{1} b_{1}}^{T}$. And so, the result follows by Lemma 3.3. Assume the statement is true for all graphs with less edges than $G$. Note that $\mathcal{P}_{G}^{T}=\left(\cup_{i=1}^{|E(G)|-1} \mathcal{P}_{a_{i} b_{i}}^{T}\right) \cup \mathcal{P}_{a_{|E(G)|} \mid b_{|E(G)|}}^{T}$. By the inductive step and Lemma 3.3, each of $\cup_{i=1}^{|E(G)|-1} \mathcal{P}_{a_{i} b_{i}}^{T}$ and $\mathcal{P}_{a_{|E(G)|} \mid{ }_{|E(G)|}}^{T}$ is linearly independent. Note that

$$
E\left(\bigcup_{i=1}^{|E(G)|-1} \mathcal{P}_{a_{i} b_{i}}^{T}\right) \cap E\left(\mathcal{P}_{a_{|E(G)|}^{T} b_{|E(G)|}}^{T}\right) \subseteq E\left(\left\{a_{|E(G)|}, b_{|E(G)|}\right\} \square T\right)
$$

which is an edge set of a forest. Thus, by Proposition $3.2, \mathcal{P}_{G}^{T}$ is linearly independent.

Throughout this paper, $T_{G}$ denotes a spanning tree of the graph $G$.
Lemma 3.5. $\mathcal{P}_{G}^{T} \cup \mathcal{B}_{G \square w_{0}}$ is linearly independent where $\mathcal{B}_{G \square w_{0}}$ is a basis for the $G$-fiber $G \square w_{0}$.

Proof. Note that if $G$ is a tree, then $\mathcal{B}_{G \square w_{0}}=\varnothing$ and so the result is obtaind by Lemma 3.4. Therefore, we now consider the case that $G$ is not a tree. By Lemma 3.4, $\mathcal{P}_{T_{G}}^{T}$ is linearly independent. Now, since $\mathcal{B}_{G \square w_{0}}$ is a basis of the $G$-fiber $G \square w_{0}$, any linear combination of $\mathcal{B}_{G \square w_{0}}$ must contain an edge of $E\left(\left(G-T_{G}\right) \square w_{0}\right)$, which is not in any cycle of $\mathcal{P}_{T_{G}}^{T}$. Thus, $\mathcal{P}_{T_{G}}^{T} \cup \mathcal{B}_{G \square w_{0}}$ is linearly independent. Now, we proceed using mathematical induction on the number of edges in $G-T_{G}$ to show that $\mathcal{P}_{G}^{T} \cup \mathcal{B}_{G \square w_{0}}$ is linearly independent. Let $E\left(G-T_{G}\right)=\left\{a_{\left|E\left(T_{G}\right)\right|+1} b_{\left|E\left(T_{G}\right)\right|+1}, a_{\left|E\left(T_{G}\right)\right|+2} b_{\left|E\left(T_{G}\right)\right|+2}, \ldots\right.$, $\left.a_{|E(G)|} b_{|E(G)|}\right\}$. Note that

$$
\begin{aligned}
& E\left(\mathcal{P}_{a_{\left|E\left(T_{G}\right)\right|+1} b_{\left|E\left(T_{G}\right)\right|+1}}^{T}\right) \cap E\left(\mathcal{P}_{T_{G}}^{T} \cup \mathcal{B}_{G \square w_{0}}\right) \\
& =E\left(\left\{a_{\left|E\left(T_{G}\right)\right|+1}, b_{\left|E\left(T_{G}\right)\right|+1}\right\} \square T\right) \cup\left\{\left(a_{\left|E\left(T_{G}\right)\right|+1}, w_{0}\right)\left(b_{\left|E\left(T_{G}\right)\right|+1}, w_{0}\right)\right\}
\end{aligned}
$$

which is an edge set of a tree. Thus, by Proposition 3.2, $\mathcal{P}_{T_{G}}^{T} \cup \mathcal{B}_{G \square w_{0}} \cup$ $\mathcal{P}_{a_{\left|E\left(T_{G}\right)\right|+1} b_{\left|E\left(T_{G}\right)\right|+1}}$ is linearly independent. By continuing in this way, using mathematical induction and by Lemma 3.3, we have that both of $\mathcal{P}_{T_{G}}^{T} \cup$ $\mathcal{B}_{G \square w_{0}} \cup\left(\cup_{i=\left|E\left(T_{G}\right)\right|+1}^{|E(G)|-1} \mathcal{P}_{a_{i} b_{i}}^{T}\right)$ and $\mathcal{P}_{a_{\mid E(G)} \mid b_{|E(G)|}}^{T}$ are linearly independent. Now,

$$
\begin{aligned}
& E\left(\mathcal{P}_{a_{|E(G)|}^{T}| | E(G) \mid}^{T}\right) \cap E\left(\left(\mathcal{P}_{T_{G}}^{T} \cup \mathcal{B}_{G \square w_{0}} \cup\left(\bigcup_{i=\left|E\left(T_{G}\right)\right|+1}^{|E(G)|-1} \mathcal{P}_{a_{i} b_{i}}^{T}\right)\right)\right. \\
& =E\left(\left\{a_{|E(G)|}, b_{|E(G)|}\right\} \square T\right) \cup\left\{\left(a_{|E(G)|}, w_{0}\right)\left(b_{|E(G)|}, w_{0}\right)\right\}
\end{aligned}
$$

which is a tree. Hence, by Proposition 3.2, $\mathcal{P}_{G}^{T} \cup \mathcal{B}_{G \square w_{0}}$ is an independent set.

Let $G$ and $H$ be two graphs, $T_{G}$ and $T_{H}$ be any two spanning trees of $G$ and $H$, respectively. Let $a_{1}$ be an end vertex of $T_{G}$. Construct a rooted tree, $T_{G}^{*}$, by assuming that $a_{1}$ is the root and all the other vertices of $T_{G}$ are directed a way from $a_{1}$. Consider the edges of the rooted tree are the following $e_{1}=$ $a_{1} b_{1}, e_{2}=a_{2} b_{2}, \ldots, e_{\left|E\left(T_{G}\right)\right|}=a_{\left|E\left(T_{G}\right)\right|} b_{\left|E\left(T_{G}\right)\right|}$. Without loss of generality we can order the edges in such a way that $\delta\left(a_{1}, a_{i}\right) \leq \delta\left(a_{1}, a_{i+1}\right)=\delta\left(a_{1}, b_{i+1}\right)-1$ where $\delta(x, y)$ denotes the distant between $x$ and $y$. In this way we guarantee that $V\left(e_{i}\right) \cap V\left(\cup_{j=1}^{i-1} e_{j}\right)$ is exactly one vertex, $a_{i}$. For a vertex $w_{0} \in V(H)$, set

$$
\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}=\left(\mathcal{P}_{b_{1} a_{1}, w_{0}}^{H-T_{H}}\right) \cup\left(\bigcup_{i=1}^{\left|E\left(T_{G}\right)\right|} \mathcal{P}_{a_{i} b_{i}, w_{0}}^{H-T_{H}}\right)
$$

Lemma 3.6. The set $\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$ is linearly independent.
Proof. Note that $E\left(\mathcal{P}_{a_{i} b_{i}, w_{0}}^{H-T_{H}}\right) \cap E\left(\mathcal{P}_{a_{j} b_{j}, w_{0}}^{H-T_{H}}\right)=\varnothing$ for each $i \neq j$. Thus, $\cup_{i=1}^{\left|E\left(T_{G}\right)\right|} \mathcal{P}_{a_{i} b_{i}, w_{0}}^{H-T_{H}}$ is linearly independent. Also, note that $E\left(\mathcal{P}_{b_{1} a_{1}, w_{0}}^{H-T_{H}}\right) \cap$ $E\left(\cup_{i=1}^{\left|E\left(T_{G}\right)\right|} \mathcal{P}_{a_{i} b_{i}, w_{0}}^{H-T_{H}}\right)=\left\{\left(a_{1}, w_{0}\right)\left(b_{1}, w_{0}\right)\right\}$. Thus, by Proposition 3.2, $\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$ is linearly independent.

We now have the results needed to prove the following result:
Theorem 3.7. Let $G$ and $H$ be any two graphs. Then $\mathcal{B}(G, H)=\mathcal{P}_{G}^{T_{H}} \cup$ $\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right) \cup \mathcal{B}_{G \square w_{0}}$ is a basis for $\mathcal{C}(G[H])$ where $\mathcal{B}_{G \square w_{0}}$ is a basis for $\mathcal{C}\left(G \square w_{0}\right)$.

Proof. Since

$$
\begin{aligned}
E\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)-E\left(T_{G} \square\left(H-T_{H}\right)\right)= & \left\{\left(b_{i}, w_{0}\right)\left(a_{i}, w\right) \mid w \in V(H)\right\} \\
& \cup\left(\bigcup_{i=1}^{\left|E\left(T_{H}\right)\right|}\left\{\left(a_{i}, w_{0}\right)\left(b_{i}, w\right) \mid w \in V(H)\right\}\right),
\end{aligned}
$$

which is an edge set of a tree, as a result each linear combination of cycles of $\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$ must contain an edge of $a_{i} \square\left(H-T_{H}\right)$ for some $a_{i} \in V(G)$ which is not in any cycle of $\mathcal{P}_{G}^{T_{H}} \cup \mathcal{B}_{G \square w_{0}}$. Thus, $\mathcal{B}(G, H)$ is linearly independent. Now, for any vertex $w \in V(H)$ and edge $a b$, we have that

$$
\begin{equation*}
\left|\mathcal{P}_{a b, w}^{T_{H}}\right|=\sum_{u v \in E\left(T_{H}\right)}\left|\mathcal{P}_{a b, w}^{u v}\right|=\sum_{u v \in E\left(T_{H}\right)} 1=\left|E\left(T_{H}\right)\right| . \tag{3}
\end{equation*}
$$

Similarly, we have that

$$
\begin{equation*}
\left|\mathcal{P}_{b a, w}^{H-T_{H}}\right|=\left|E\left(H-T_{H}\right)\right| . \tag{4}
\end{equation*}
$$

Thus, by (3) and the defintion of $\mathcal{P}_{a b}^{T_{H}}$, we have

$$
\begin{aligned}
\left|\mathcal{P}_{a b}^{T_{H}}\right| & =\left|\mathcal{P}_{b a, w_{0}}^{T_{H}}\right|+\sum_{w \in V\left(T_{H}\right)}\left|\mathcal{P}_{a b, w}^{T_{H}}\right| \\
& =\left|E\left(T_{H}\right)\right|+\sum_{w \in V\left(T_{H}\right)}\left|E\left(T_{H}\right)\right|=\left|E\left(T_{H}\right)\right|+|V(H)|\left|E\left(T_{H}\right)\right| \\
& =|V(H)|^{2}-1 .
\end{aligned}
$$

Hence,

$$
\begin{aligned}
\left|\mathcal{P}_{G}^{T_{H}}\right| & =\sum_{i=1}^{|E(G)|}\left|\mathcal{P}_{a_{i} b_{i}}^{T_{H}}\right|=\left(|V(H)|^{2}-1\right)|E(G)| \\
& =|E(G)||V(H)|^{2}-|E(G)| .
\end{aligned}
$$

Also, by (4) and by noting that $\operatorname{dim} \mathcal{C}(H)=\left|E\left(H-T_{H}\right)\right|$, we have that

$$
\begin{aligned}
\left|\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right| & =\left|\mathcal{P}_{b_{1} a_{1}, w_{0}}^{H-T_{H}}\right|+\sum_{i=1}^{\left|E\left(T_{G}\right)\right|}\left|\mathcal{P}_{a_{i} b_{i}, w_{0}}^{H-T_{H}}\right| \\
& =\left|E\left(H-T_{H}\right)\right|+\left|E\left(T_{G}\right)\right|\left|E\left(H-T_{H}\right)\right| \\
& =\operatorname{dim} \mathcal{C}(H)+\left|E\left(T_{G}\right)\right| \operatorname{dim} \mathcal{C}(H) .
\end{aligned}
$$

Moreover, we know that

$$
\left|\mathcal{B}_{G \square w_{0}}\right|=\operatorname{dim} \mathcal{C}(G) .
$$

Therefore,

$$
\begin{aligned}
& |\mathcal{B}(G, H)| \\
& =\left|\mathcal{P}_{G}^{T_{H}}\right|+\left|\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right|+\left|\mathcal{B}_{G \square w_{0}}\right| \\
& =|E(G)||V(H)|^{2}-|E(G)|+\operatorname{dim} \mathcal{C}(H)+\left|E\left(T_{G}\right)\right| \operatorname{dim} \mathcal{C}(H)+\operatorname{dim} \mathcal{C}(G) \\
& =|E(G)||V(H)|^{2}+\operatorname{dim} \mathcal{C}(H)\left(\left|E\left(T_{G}\right)\right|+1\right)-|E(G)|+\operatorname{dim} \mathcal{C}(G) \\
& =|E(G)||V(H)|^{2}+\operatorname{dim} \mathcal{C}(H)|V(G)|-|E(G)|+\operatorname{dim} \mathcal{C}(G) .
\end{aligned}
$$

But, by (1)

$$
-|E(G)|+\operatorname{dim} \mathcal{C}(G)=-|V(G)|+1
$$

Thus,

$$
\begin{aligned}
|\mathcal{B}(G, H)| & =|E(G)||V(H)|^{2}+\operatorname{dim} \mathcal{C}(H)|V(G)|-|V(G)|+1 \\
& =|E(G)||V(H)|^{2}+(|E(H)|-|V(H)|+1)|V(G)|-|V(G)|+1 \\
& =|E(G)||V(H)|^{2}+|E(H)||V(G)|-|V(G)||V(H)|+1 \\
& =\operatorname{dim} \mathcal{C}(G[H])
\end{aligned}
$$

where the last equality holds by (2). Therefore, $\mathcal{B}(G, H)$ is a basis for $\mathcal{C}(G[H])$.

Remark 3.8. (i) By specializing $G$ to be a tree $T$, we have that $\mathcal{B}_{G \square w_{0}}=\varnothing$ and so, $\mathcal{B}(T, H)=\mathcal{P}_{T}^{T_{H}} \cup\left(\mathcal{A}_{T^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)$ is a basis for $\mathcal{C}(T[H])$ where $T^{*}$ is a rooted tree for $T$.
(ii) By specializing $H$ to be a tree $T$, we have that $\mathcal{A}_{T^{*}, w_{0}}^{\left(H-T_{H}\right)}=\varnothing$ and so, $\mathcal{B}(G, T)=\mathcal{P}_{G}^{T} \cup \mathcal{B}_{G \square w_{0}}$ is a basis for $\mathcal{C}(G[T])$.
(iii) By specializing $G$ and $H$ to be trees $T_{1}$ and $T_{2}$, respectively, we have that $\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right) \cup \mathcal{B}_{G \square w_{0}}=\varnothing$ and so, $\mathcal{B}\left(T_{1}, T_{2}\right)=\mathcal{P}_{T_{1}}^{T_{2}}$ is a basis for $\mathcal{C}\left(T_{1}\left[T_{2}\right]\right)$.

We now turn our attention to construct a minimal cycle basis for $G[H]$.
Lemma 3.9. Let $C$ be a cycle of $G[H]$ of length greater than or equal to 4 and contains an edge of an $H$-fiber. Then $C$ is irrelevant.

Proof. Assume that $C$ contains an edge of the fiber $a \square H$ for some $a \in$ $V(G)$. Then we consider two cases:

Case 1. All the edges of $C$ are from $a \square H$, say $C=\left(a, v_{1}\right)\left(a, v_{2}\right) \ldots$ $\left(a, v_{m}\right)\left(a, v_{1}\right)$. Let $a b \in E(G)$. Then

$$
C=\left(\bigoplus_{j=1}^{m-1} \mathcal{P}_{b a, v_{1}}^{v_{j} v_{j+1}}\right) \oplus \mathcal{P}_{b a, v_{1}}^{v_{m} v_{1}} .
$$

Thus, $C$ is irrelevant.

Case 2. $C$ contains at least one edge which is not in $a \square H$. Hence we may assume that $(b, w)(a, u)(a, v) \subseteq C$ where $v u \in E(H)$ and $b a \in E(G)$. Let

$$
C_{1}=C \oplus \mathcal{P}_{b a, w}^{u v} .
$$

Then,

$$
C=C_{1} \oplus \mathcal{P}_{b a, w}^{u v} .
$$

Note that $C_{1}$ is obtained from $C$ by deleting at least two edges $(b, w)(a, u)$, $(a, u)(a, v)$ and adding at most the edge $(b, w)(a, v)$. Thus, $\left|C_{1}\right|<|C|$. Hence, $C$ is irrelevant.

Figure 1. The way of getting $C_{2}$ from the ring sum of $C$ and 3 -cycles.

Lemma 3.10. Let $C$ be a cycle of $G[H]$ of length greater than or equal to 4 such that $C$ contains at least two edges from one fold of $G[H]$. Then $C$ is irrelevant.

Proof. Let $C$ be a cycle containing at least two edges from the same fold. From Lemma 3.9 we can assume that $C$ contains no edge of $V(G) \square H$. To this end, we consider the following two cases:

Case 1. $E(C)$ belongs to only one fold, say $a b[H]$ and so belongs to $a b\left[N_{H}\right]$ where $N_{H}$ is the null graph with vertex set is $V(H)$. By (iii) of Remark 3.8, $\mathcal{P}_{a b}^{T_{H}}$ is a basis of $a b\left[T_{H}\right]$. Thus, $C$ can be written as a linear combination of some cycles of $\mathcal{P}_{a b}^{T_{H}}$. Hence, $C$ is irrelevant.

Case 2. $E(C)$ belongs to at least two folds. Then we consider two subcases:

Subcase 2a. There is a fold, say $a b[H]$, contaning two adjacent edges of $E(C)$. Consider $(c, x)(b, u)(a, w)(b, v) \subseteq C$, that is the two adjacent edges in $a b\left[N_{H}\right]$ are $(b, u)(a, w)$ and $(a, w)(b, v)$ and $(c, x)(b, u) \notin E(a b[H])$. Let $u=u_{1} u_{2} \ldots u_{t}=v$ be the path of $T_{H}$ connecting $u$ and $v$ and so $(b, u)=\left(b, u_{1}\right)\left(b, u_{2}\right) \ldots\left(b, u_{t}\right)=(b, v)$ is a path in $G\left[T_{H}\right] \subseteq G[H]$ connecting the two vertices $(b, u)$ and $(b, v)$. Let

$$
C_{2}=C \oplus \bigoplus_{j=1}^{t-1} \mathcal{P}_{a b, w}^{u_{i} u_{i+1}} \oplus \bigoplus_{j=1}^{t-1} \mathcal{P}_{c b, x}^{u_{i} u_{i+1}}
$$

Then

$$
C=C_{2} \oplus \bigoplus_{j=1}^{t-1} \mathcal{P}_{a b, w}^{u_{i} u_{i+1}} \oplus \bigoplus_{j=1}^{t-1} \mathcal{P}_{c b, x}^{u_{i} u_{i+1}}
$$

Note that $\left|C_{2}\right| \leq|C|-2$ because $C_{2}$ is obtained by deleting at least $(b, u)$ $(a, w),(a, w)(b, v)$ and $(c, x)(b, u)$ and adding at most $(c, x)(b, v)$ (see Figure 1). Thus, $C$ is irrelevant.

Subcase 2 b . There is no fold containing two adjacent edges of $E(C)$. Consider the fold $a b[H]$ contains two non adjacent edges of $E(C)$, say $(c, x)(b, u)(a, w)$ and $(b, v)(a, y) \subseteq C$. That is the two non adjacent edges of the same fold are $(b, u)(a, w)$ and $(b, v)(a, y)$ and $(c, x)(b, u) \notin a b[H]$. Let $u=u_{1} u_{2} \ldots u_{t}=v$ be the path of $T_{H}$ connecting $u$ and $v$ and so $(b, u)=\left(b, u_{1}\right)\left(b, u_{2}\right) \ldots\left(b, u_{t}\right)=(b, v)$ be a path in $G\left[T_{H}\right] \subseteq G[H]$ connecting the two vertices $(b, u)$ and $(b, v)$. Thus,

$$
C_{3}=C \oplus \bigoplus_{j=1}^{t-1} \mathcal{P}_{c b, x}^{u_{i} u_{i+1}} \bigoplus_{j=1}^{t-1} \mathcal{P}_{a b, w}^{u_{i} u_{i+1}}
$$

is a union of at least to edge disjoint cycles (because in this way we unify the vertices $(b, u)$ and $(b, v))$ each of which is of length less than the length of $C$, say $C_{3}=\cup_{i=1}^{r} C_{i}^{\prime}$. Then

$$
C_{3}=\bigoplus_{j=1}^{r} C_{i}^{\prime}
$$

And so,

$$
C=\bigoplus_{j=1}^{r} C_{i}^{\prime} \oplus \bigoplus_{j=1}^{t} \mathcal{P}_{a b, x}^{u_{i} u_{i+1}} \bigoplus_{j=1}^{t} \mathcal{P}_{c b, w}^{u_{i} u_{i+1}}
$$

Thus, $C$ is irrelevant.

Lemma 3.11. Let $C_{v}=C \square v$ and $C_{u}=C \square u$ be two cycles of the $G$-fibers $G \square u$ and $G \square v$, respectively. Then $C_{u}$ is a linear combination of $C_{v}$ with cycles of length 3 .

Proof. Let $C_{v}=\left(a_{1}, v\right)\left(a_{2}, v\right) \ldots\left(a_{n}, v\right)\left(a_{1}, v\right)$. Let $T_{H}$ be a spanning tree of $H$ and $v=v_{1} v_{2} \ldots v_{m}=u$ be the path of $T_{H}$ connecting $v$ and $u$. Then

$$
\begin{aligned}
& \left(\bigoplus_{i=1}^{n-1} \bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{i} a_{i+1}, v}^{v_{j} v_{j+1}}\right) \oplus\left(\bigoplus_{i=1}^{n-1} \bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{i+1} a_{i}, u}^{v_{j} v_{j+1}}\right) \\
& \oplus\left(\bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{n} a_{j}, v}^{v_{j} v_{j+1}}\right) \oplus\left(\bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{1} a_{n}, u}^{v_{j} v_{j+1}}\right)=C_{v} \oplus C_{u} .
\end{aligned}
$$

Thus,

$$
\begin{aligned}
C_{u}=C_{v} & \oplus\left(\bigoplus_{i=1}^{n-1} \bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{i} a_{i+1}, v}^{v_{j} v_{j+1}}\right) \oplus\left(\bigoplus_{i=1}^{n-1} \bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{i+1} a_{i}, u}^{v_{j} v_{j+1}}\right) \\
\oplus & \left(\bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{n} a_{1}, v}^{v_{j} v_{j+1}}\right) \oplus\left(\bigoplus_{j=1}^{m-1} \mathcal{P}_{a_{1} a_{n}, u}^{v_{j} v_{j+1}}\right) .
\end{aligned}
$$

Figure 2. The first step in the procedure of writing the cycle $C$ as a linear combination of cycles of a $G$-fiber $\left(G \square v_{1}\right)$ and 3 -cycles.

Lemma 3.12. Let $C$ be a cycle of $G[H]$ of length greater than or equal to 3 such that $C$ neither contains an edge of an $H$-fiber nor contains two edges of the same fold. Then $C$ is a ring sum of cycles of length 3 with cycles of a $G$-fiber.

Proof. Let $C=\left(a_{1}, v_{1}\right)\left(a_{2}, v_{2}\right) \ldots\left(a_{m}, v_{m}\right)\left(a_{1}, v_{1}\right)$. Since $C$ neither contains an edge of an $H$-fiber nor contains two edges of the same fold, as a result $C$ contains no edge of $\cup_{a \in v(G)}(a \square H)$ and contains at most one edge of $e\left[N_{H}\right]$ for each $e \in E(G)$. And so, $a_{1} a_{2} \ldots a_{m} a_{1}$ is a cycle or edge disjoint union of cycles of $G$. Now, we show that $C$ is a linear combination of 3 -cycles with cycles of the fiber $G \square v_{1}$. Let $v_{1}=v_{1_{1}} v_{1_{2}} \ldots v_{1_{n_{1}}}=v_{2}$ be the path of $T_{H}$ connecting the two vertices $v_{1}$ and $v_{2}$. Let

$$
C_{1}=C \oplus\left(\bigoplus_{j=1}^{n_{1}-1} \mathcal{P}_{a_{1} a_{2}, v_{1}}^{v_{1} v_{1} v_{j+1}}\right) \oplus\left(\bigoplus_{j=1}^{n_{1}-1} \mathcal{P}_{a_{3} a_{2}, v_{3}}^{v_{1}, v_{1+1}}\right) .
$$

Note that $C_{1}$ is obtained from $C$ by pulling the vertex $\left(a_{2}, v_{2}\right)$ to $\left(a_{2}, v_{1}\right)$. Thus, $C_{1}$ is a cycle or an edge disjoint union of cycles each of which has the same properties as $C$ (see Figure 2). Now, Let $v_{1}=v_{2_{1}} v_{2_{2}} \ldots v_{2_{n_{2}}}=v_{3}$ be the path of $T_{H}$ joining the two vertices $v_{1}$ and $v_{3}$. Let

$$
C_{2}=C_{1} \oplus\left(\bigoplus_{j=1}^{n_{2}-1} \mathcal{P}_{a_{2} a_{3}, v_{2}}^{v_{2} v_{2}}\right) \oplus\left(\bigoplus_{j=1}^{n_{2}-1} \mathcal{P}_{a_{4} a_{3}, v_{4}}^{v_{2} v_{j+1}}\right)
$$

Similarly, note that $C_{2}$ is obtained from $C_{1}$ by pulling the vertex $\left(a_{3}, v_{3}\right)$ to $\left(a_{3}, v_{1}\right)$. Thus, $C_{2}$ is a cycle or an edge disjoint union of cycles each of which has the same properties as $C_{1}$. By continuing in this process, we get a cycle or edge disjoint union of cycles $C_{m-1}$ which obtained from cycles of length 3 and $C_{m-2}$ each of which has the same properties as $C_{m-2}$. Moreover, each vertex of $C_{m-1}$ lies on the fiber $G \square v_{1}$ except possibly the vertex ( $a_{m}, v_{m}$ ). To this end, let $v_{1}=v_{(m-1)_{1}} v_{(m-1)_{2}} \ldots v_{(m-1)_{n_{(m-1)}}}=v_{m}$ be the path of $T_{H}$ joining the two vertices $v_{1}$ and $v_{m}$. Let

$$
C_{m}=C_{m-1} \oplus\left(\bigoplus_{j=1}^{n_{(m-1)}-1} \mathcal{P}_{a_{m-1} a_{m}, v_{m-1}}^{v_{1} v_{1} v_{j+1}}\right) \oplus\left(\bigoplus_{j=1}^{n_{(m-1)}-1} \mathcal{P}_{a_{1} a_{m}, v_{1}}^{v_{1} v_{1+1}}\right) .
$$

Then $C_{m}=\left(a_{1}, v_{1}\right)\left(a_{2}, v_{1}\right) \ldots\left(a_{m}, v_{1}\right)\left(a_{1}, v_{1}\right)$ which is a cycle or edge disjoint union of cycles of the fiber $G \square v_{1}$. Hence,

$$
\begin{aligned}
C_{m}=C \oplus & \left(\bigoplus_{j=1}^{n_{1}-1} \mathcal{P}_{a_{1} a_{2}, v_{1}}^{v_{1} v_{1}}\right) \oplus\left(\bigoplus_{j=1}^{n_{1}-1} \mathcal{P}_{a_{3} a_{2}, v_{3}}^{v_{1} v_{1}}\right) \oplus \cdots \oplus \\
& \binom{\bigoplus_{j=1}^{n_{(m-1)}-1}}{\mathcal{P}_{a_{m-1}}^{v_{1}} a_{m}, v_{m-1}} \oplus\left(\bigoplus_{j=1}^{v_{1} v_{1-1}} \mathcal{P}_{a_{1} a_{m}, v_{1}}^{v_{1}}\right) .
\end{aligned}
$$

Thus,

$$
\begin{aligned}
& C=C_{m} \oplus\left(\bigoplus_{j=1}^{n_{1}-1} \mathcal{P}_{a_{1} a_{2}, v_{1}}^{v_{1} v_{1}}\right) \oplus\left(\bigoplus_{j=1}^{n_{1}} \mathcal{P}_{a_{3} a_{2}, v_{3}}^{n_{1}-1}\right) \oplus \cdots \oplus
\end{aligned}
$$

Lemma 3.13. Every cycle of length three of $G[H]$ which contains at least one edge of an $H$-fiber can be written as a linear combination of $\mathcal{P}_{G}^{T_{H}} \cup$ $\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)$.

Proof. Let $C$ be a 3 -cycle which contains at least one edge of an $H$-fiber. We consider two cases:

Case 1. $C$ is subgraph of an $H$-fiber. Then $C$ is a subgraph of $T_{G}[H]$. By (i) of Remark $3.8 \mathcal{P}_{T_{G}}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)$ is a basis of $T_{G}[H]$. Thus, $C$ can be written as a linear combination of $\mathcal{P}_{T_{G}}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)$.

Case 2. $C$ is not a subgraph of an $H$-fiber. Since $C$ contains at least one edge of an $H$-fiber, $C$ belongs to a fold of $H$. Note that, by (i) of Remark 3.8,

$$
\mathcal{P}_{a b, w_{0}}^{H-T_{H}} \cup \mathcal{P}_{b a, w_{0}}^{H-T_{H}} \cup\left(\cup_{w \in V(T)} \mathcal{P}_{a b, w}^{T_{H}}\right) \cup \mathcal{P}_{b a, w_{0}}^{T_{H}}
$$

is a basis for $a b[H]$ for any $a b \in E(G)$. Thus, to prove the lemma it is enough to show that each cycle of $\mathcal{P}_{a b, w_{0}}^{H-T_{H}} \cup \mathcal{P}_{b a, w_{0}}^{H-T_{H}}$ can be written as
a linear combination of $\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)$ for any $a b \in E(G)$. Let $\left\{e_{1}=\right.$ $\left.a_{1} b_{1}, e_{2}=a_{2} b_{2} \ldots e_{\left|E\left(T_{G}\right)\right|}=a_{\left|E\left(T_{G}\right)\right|} b_{\left|E\left(T_{G}\right)\right|}\right\}$ be the edge set of the rooted tree $T_{G}^{*}$. Note that

$$
\mathcal{P}_{b_{1} a_{1}, w_{0}}^{H-T_{H}} \cup \mathcal{P}_{a_{1} b_{1}, w_{0}}^{H-T_{H}} \subseteq \mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}
$$

Thus, the result is obtained if $a b=a_{1} b_{1}$. Now, we show that the result is true for each edge $e=a b \in E(G)$ different from $a_{1} b_{1}$. To this end, we consider two subcases:

Subcase 1. $e=a b \in T_{G}^{*}$. With out loss of generality, we can assume that $e_{1} e_{2} \ldots e_{l}$ be the path of $T_{G}^{*}$ joining $a_{1} b_{1}$ with $a b$, say $e_{1}=a_{1} b_{1}=a_{1_{1}} b_{1_{1}}$ and $e_{2}=a_{1_{2}} b_{1_{2}}, \ldots, e_{l}=a_{1_{l}} b_{1_{l}}=a b$. Now, for each $u v \in E\left(H-T_{H}\right)$, let $u=u_{1} u_{2} \ldots u_{t}=v$ be the path of $T_{H}$ connecting $u$ and $v$, Hence, $u_{1} u_{2} \ldots u_{t} u_{1}$ is the cycle of $H$ containing $u v=u_{t} u_{1}$. Note that

$$
\mathcal{P}_{b_{1_{2}} a_{1_{2}}, w_{0}}^{u v}=C_{b_{1}}^{*} \oplus \bigoplus_{i=1}^{t-1} \mathcal{P}_{b_{1_{2}} a_{1_{2}}, w_{0}}^{u_{i} u_{i+1}}
$$

where $C_{b_{1_{1}}}^{*}:\left(b_{1_{1}}, u_{1}\right)\left(b_{1_{1}}, u_{2}\right) \ldots\left(b_{1_{1}}, u_{t}\right)\left(b_{1_{1}}, u_{1}\right) . C_{b_{1_{1}}}^{*}$ can be written as a linear combinations of cycle of $\mathcal{P}_{b_{1} a_{1}, w_{0}}^{H-T_{H}} \cup \mathcal{P}_{a_{1_{1} b_{1}}, w_{0}}^{H-T_{H}} \cup\left(\cup_{w \in V(T)} \mathcal{P}_{a_{1_{1}} b_{1}, w}^{T_{H}}\right) \cup$ $\mathcal{P}_{b_{1_{1}} a_{1}, w_{0}}^{T_{H}}$ because $C_{b_{1}}^{*}$ is a cycle of $a_{1_{1}} b_{1_{1}}[H]=a_{1} b_{1}[H]$ and $\mathcal{P}_{b_{1_{1}} a_{1_{1}}, w_{0}}^{H-T_{H}} \cup$ $\mathcal{P}_{a_{1_{1} b_{1}}, w_{0}}^{H-T_{H}} \cup\left(\cup_{w \in V(T)} \mathcal{P}_{a_{1_{1}} b_{1}, w}^{T_{H}}\right) \cup \mathcal{P}_{b_{1_{1}} a_{1_{1}}, w_{0}}^{T_{H}}$ is a basis of $\mathcal{C}\left(a_{1_{1}} b_{1_{1}}[H]\right)$. Moreover, by (iii) of Remark 3.8, $\mathcal{P}_{b_{1_{2}} a_{1_{2}}, w_{0}}^{u_{i} u_{i+1}}$ can be written as a linear combinations of cycles of $\mathcal{P}_{e_{2}}^{T_{H}}$ because $\mathcal{P}_{e_{2}}^{T_{H}}$ is a basis of $\mathcal{C}\left(e_{2}\left[T_{H}\right]\right)$. Thus, $\mathcal{P}_{b_{1_{2}} a_{1_{2}}, w_{0}}^{u v}$ can be written as a linear combination of cycles of $\mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$. Now, by a similar argument

$$
\mathcal{P}_{b_{1_{3}} a_{1}, w_{0}}^{u v}=C_{b_{1}}^{*} \oplus \bigoplus_{i=1}^{t-1} \mathcal{P}_{b_{1_{3}} a_{1_{3}}, w_{0}}^{u_{i} u_{i+1}}
$$

where $C_{b_{1_{2}}}^{*}:\left(b_{1_{2}}, u_{1}\right)\left(b_{1_{2}}, u_{2}\right) \ldots\left(b_{1_{2}}, u_{t}\right)\left(b_{1_{2}}, u_{1}\right)$ which can be written as a linear combinations of cycle of $\mathcal{P}_{b_{1_{1}} a_{1_{1}}, w_{0}}^{H-T_{H}} \cup\left(\cup_{i=1}^{2} \mathcal{P}_{a_{i} b_{1}, w_{0}}^{H-T_{H}}\right) \cup$ $\left(\cup_{w \in V(T)} \cup_{i=1}^{2} \mathcal{P}_{a_{1_{i}} b_{1_{i}}, w}^{T_{H}}\right) \cup \mathcal{P}_{b_{1_{1}} a_{1_{1}}, w_{0}}^{T_{H}}$ because $\mathcal{P}_{b_{1_{1}} a_{1_{1}}, w_{0}}^{H-T_{H}} \cup\left(\cup_{i=1}^{2} \mathcal{P}_{a_{1_{i}} b_{i}, w_{0}}^{H-T_{H}}\right) \cup$ $\left(\cup_{w \in V(T)} \cup_{i=1}^{2} \mathcal{P}_{a_{1_{i}} b_{1_{i}}, w}^{T_{H}}\right) \cup \mathcal{P}_{b_{1_{1}} a_{1}, w_{0}}^{T_{H}}$ is a basis of $\mathcal{C}\left(e_{1} \cup e_{2}[H]\right)$ by (i) of

Remark 3.8. Moreover, by (iii) of Remark 3.8, $\mathcal{P}_{b_{1} a_{13} a_{3}, w_{0}}^{u_{i} u_{i+1}}$ can be written as a linear combinations of cycles of $\mathcal{P}_{e_{3}}^{T_{H}}$ because $\mathcal{P}_{e_{3}}^{T_{H}}$ is a basis of $\mathcal{C}\left(e_{3}\left[T_{H}\right]\right)$. Thus, $\mathcal{P}_{b_{1_{3}} a_{1}, w_{0}}^{u v}$ can be written as a linear combination of cycles of $\mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$. By continuing in this procedure we show that for each $u v \in E\left(H-T_{H}\right)$,

$$
\mathcal{P}_{b_{1_{l}} a_{1}, w_{0}}^{u v}=C_{b_{1_{l}}}^{*} \oplus \bigoplus_{i=1}^{t-1} \mathcal{P}_{b_{l_{l}} a_{l}, w_{0}}^{u_{i} u_{i+1}}
$$

where $C_{b_{1_{l}}}^{*}:\left(b_{1_{l-1}}, u_{1}\right)\left(b_{1_{l-1}}, u_{2}\right) \ldots\left(b_{1_{l-1}}, u_{t}\right)\left(b_{1_{l-1}}, u_{1}\right)$ which can be written as a linear combinations of cycle of $\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}, w_{0}}^{\left(H-T_{G}\right)}\right)$. Moreover, by (iii) of Remark 3.8, $\mathcal{P}_{e_{l}, w_{0}}^{u_{i} w_{i+1}}$ can be written as a linear combinations of cycles of $\mathcal{P}_{e_{l}}^{T_{H}}$ because it is a basis of $\mathcal{C}\left(e_{l}\left[T_{H}\right]\right)$. Thus, each cycle of $\mathcal{P}_{b a, w_{0}}^{H-T_{H}}$ can be written as a linear combination of cycles of $\mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$. Since $\mathcal{P}_{a b, w_{0}}^{H-T_{H}} \subseteq \mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$, as a result each cycle of $\mathcal{P}_{a b, w_{0}}^{H-T_{H}} \cup \mathcal{P}_{b a, w_{0}}^{H-T_{H}}$ can be written as a linear combinations of cycles of $\mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$.

Subcase 2. $e=a b \notin T_{G}^{*}$. Assume that $P=e_{1} e_{2} \ldots e_{l}$ be a path of $T_{G}^{*}$ joining $a_{1} b_{1}$ and $a$, and $P^{*}=e_{1}^{*} e_{2}^{*} \ldots e_{k}^{*}$ be a path of $T_{G}^{*}$ joining $a_{1} b_{1}$ and $b$. By applying the same argument as in Subcase 1 on $P \cup a b$ and $P^{*} \cup b a$, we get $\mathcal{P}_{b a, w_{0}}^{u v}$ and $\mathcal{P}_{a b, w_{0}}^{u v}$, respectively, for any $u v \in E\left(H-T_{H}\right)$. Thus, each cycle of $\mathcal{P}_{a b, w_{0}}^{H-T_{H}} \cup \mathcal{P}_{b a, w_{0}}^{H-T_{H}}$ can be written as a linear combination of cycles of $\mathcal{P}_{G}^{T_{H}} \cup \mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}$.
Note that if each vertex of the cycle basis $\mathcal{B}$ is relevant, then $\mathcal{B}$ is minimal.
Theorem 3.14. Let $G$ and $H$ be any two graphs. If $\mathcal{B}_{G \square w_{0}}$ is a minimal cycle basis of $G \square w_{0}$, then $\mathcal{B}(G, H)=\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}}^{\left(H-T_{H}\right)}\right) \cup \mathcal{B}_{G \square w_{0}}$ is a minimal cycle basis of $G[H]$.

Proof. Let $\mathcal{B}$ be a minimal cycle basis of $G[H]$ obtained by applying the Greedy algorithm. Since $\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)$ is a linearly independent set consisting of 3-cycles, as a result we may assume that $\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right) \subseteq \mathcal{B}$. Now, let $\mathcal{S}=\mathcal{B}-\left(\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}^{*}, w_{0}}^{\left(H-T_{H}\right)}\right)\right)$. By Lemmas 3.9, 3.11 and 3.13 each cycle of $\mathcal{S}$ neither contains an edge of any $H$-fiber nor contains two edges
of the same fold of $H$. Thus, the cycles of $\mathcal{S}$ must be as in Lemma 3.12. Since $\mathcal{B}$ is a minimal cycle basis, then each cycle of $\mathcal{S}$ is relevant. Now, by Lemmas 3.12 and 3.11 , each cycle of $\mathcal{S}$ is a linear combination of cycles of length three (of the form $\mathcal{P}_{a b, w}^{u v}$ ) with cycle corresponding to a cycle of $G \square w_{0}$ of the same length. By Lemma 3.12 and 3.13, those corresponding cycles of $G \square w_{0}$ must be linearly independent. Since $|\mathcal{S}|=\operatorname{dim} \mathcal{C}\left(G \square w_{0}\right)$, as a result the set of corresponding cycles of cycles of $\mathcal{S}$ is a basis for $G \square w_{0}$. Thus, $l(\mathcal{S}) \geq l\left(\mathcal{B}_{G \square w_{0}}\right)$. Hence,

$$
\begin{aligned}
l(\mathcal{B}) & =l\left(\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}}^{\left(H-T_{H}\right)}\right)\right)+l(\mathcal{S}) \\
& \geq l\left(\mathcal{P}_{G}^{T_{H}} \cup\left(\mathcal{A}_{T_{G}}^{\left(H-T_{H}\right)}\right)\right)+l\left(\mathcal{B}_{G \square w_{0}}\right) \\
& =l(\mathcal{B}(G, H))
\end{aligned}
$$

On the other hand, since $\mathcal{B}$ is minimal, we have that

$$
l(\mathcal{B}) \leq l(\mathcal{B}(G, H))
$$

Thus,

$$
l(\mathcal{B})=l(\mathcal{B}(G, H))
$$

Therefore, $\mathcal{B}(G, H)$ is minimal.
The following two corollaries are straightforward from theorem 3.14.
Corollary 3.15. $l(G[H])=3\left(|E(G)||V(H)|^{2}+\operatorname{dim} \mathcal{C}(H)|V(G)|-|E(G)|\right)+$ $l(G)$.

Corollary 3.16. $\lambda(G[H])=\max \{3, \lambda(G)\}$.
