#### Abstract

For a given graph $G=(V(G), E(G))$, a proper total coloring $\phi: V(G) \cup$ $E(G) \rightarrow\{1,2, \ldots, k\}$ is neighbor sum distinguishing if $f(u) \neq f(v)$ for each edge $u v \in E(G)$, where $f(v)=\sum_{u v \in E(G)} \phi(u v)+\phi(v), v \in V(G)$. The smallest integer $k$ in such a coloring of $G$ is the neighbor sum distinguishing total chromatic number, denoted by $\chi_{\Sigma}^{\prime \prime}(G)$. Pilśniak and Woźniak first introduced this coloring and conjectured that $\chi_{\Sigma}^{\prime \prime}(G) \leq \Delta(G)+3$ for any graph with maximum degree $\Delta(G)$. In this paper, by using the discharging method, we prove that for any planar graph $G$ without 5 -cycles, $\chi_{\Sigma}^{\prime \prime}(G) \leq$ $\max \{\Delta(G)+2,10\}$. The bound $\Delta(G)+2$ is sharp. Furthermore, we get the exact value of $\chi_{\Sigma}^{\prime \prime}(G)$ if $\Delta(G) \geq 9$.

Keywords: neighbor sum distinguishing total coloring, discharging method, planar graph.
2010 Mathematics Subject Classification: 05C15.

[^0]
## 1. Introduction

In this paper, all graphs considered are simple, finite and undirected. For the terminology and notation not defined in this paper can be found in [1]. For a graph $G$, we denote its vertex set, edge set and maximum degree by $V(G)$, $E(G)$ and $\Delta(G)$, respectively. If $G$ is a planar graph embedded in the plane, we use $F(G)$ to denote its face set. A vertex $v$ is a $t$-vertex, $t^{-}$-vertex, $t^{+}$vertex if $d_{G}(v)=t, d_{G}(v) \leq t, d_{G}(v) \geq t$ in $G$, respectively. A $t$-face is defined similarly. An $l$-face $v_{1} v_{2} \cdots v_{l}$ is a $\left(b_{1}, b_{2}, \ldots, b_{l}\right)$-face, where $v_{i}$ is a $b_{i}$-vertex, for $i=1,2, \ldots, l$. Let $d_{G}^{t}(v)$ denote the number of $t$-vertices adjacent to $v$ in $G$. Let $n_{G}^{d}(v)$ denote the number of $d$-faces incident with $v$ in $G$. A configuration $F$ is reducible to $G$, if it cannot be a configuration of $G$.

Given a graph $G$, set $n_{i}(G)=\left|\left\{v \in V(G): d_{G}(v)=i\right\}\right|$ for $i=1,2, \ldots, \Delta(G)$. A graph $G^{\prime}$ is smaller than $G$ if one of the following holds:
(1) $\left|E\left(G^{\prime}\right)\right|<|E(G)|$,
(2) $\left|E\left(G^{\prime}\right)\right|=|E(G)|$ and $\left(n_{t}\left(G^{\prime}\right), n_{t-1}\left(G^{\prime}\right), \ldots, n_{1}\left(G^{\prime}\right)\right)$ precedes $\left(n_{t}(G), n_{t-1}(G)\right.$, $\left.\ldots, n_{1}(G)\right)$ with respect to the standard lexicographic order, where $t=$ $\max \left\{\Delta(G), \Delta\left(G^{\prime}\right)\right\}$.
A graph is minimum for a property if no smaller graph satisfies it.
Given a graph $G$ and a positive integer $k$, a proper total $k$-coloring of $G$ is a mapping $\phi: V(G) \cup E(G) \rightarrow\{1,2, \ldots, k\}$ such that $\phi(x) \neq \phi(y)$ for each pair of adjacent or incident elements $x, y \in V(G) \cup E(G)$. Let $f(v)=\sum_{u v \in E(G)} \phi(u v)+$ $\phi(v), v \in V(G)$. If $f(u) \neq f(v)$ for each edge $u v \in E(G)$, then $\phi$ is a neighbor sum distinguishing total $k$-coloring, or $k$-tnsd-coloring for simplicity. The smallest number $k$ is the neighbor sum distinguishing total chromatic number of $G$, denoted by $\chi_{\Sigma}^{\prime \prime}(G)$. For $k$-tnsd-coloring, Pilśniak and Woźniak gave the following conjecture.

Conjecture 1 [11]. For any graph $G, \chi_{\Sigma}^{\prime \prime}(G) \leq \Delta(G)+3$.
Pilśniak and Woźniak confirmed Conjecture 1 for bipartite graphs, complete graphs, cycles and subcubic graphs. Dong et al. [3] showed that Conjecture 1 holds for some sparse graphs. Yao et al. [21, 22] considered tnsd-coloring of degenerate graphs. Li et al. [9] proved that Conjecture 1 holds for $K_{4}$-minor free graphs. Song et al. [15] determined $\chi_{\Sigma}^{\prime \prime}(G)$ for $K_{4}$-minor free graph $G$ with $\Delta(G) \geq 5$. For planar graph, it was proved that this conjecture holds with $\Delta(G) \geq 13$ by Li et al. [7] and $\Delta(G) \geq 11$ by Qu et al. [12]. For planar graph, it was proved that $\chi_{\Sigma}^{\prime \prime}(G) \leq \Delta(G)+2$ holds with $\Delta(G) \geq 14$ by Cheng et al. [2], $\Delta(G) \geq 12$ by Song et al. [14] and $\Delta(G) \geq 11$ by Yang et al. [20]. The bound $\Delta(G)+2$ is sharp. Some results about planar graphs with cycle restrictions can be seen in $[5,8,10]$ and $[16-19]$. More references on tnsd-coloring can be seen in [4] and [13].

Recently, Ge et al. [6] got the following result.
Theorem 2 [6]. Let $G$ be a planar graph without 5 -cycles. Then

$$
\chi_{\Sigma}^{\prime \prime}(G) \leq \max \{\Delta(G)+3,10\}
$$

In this paper, we prove the following results.
Theorem 3. Let $G$ be a planar graph without 5 -cycles. Then

$$
\chi_{\Sigma}^{\prime \prime}(G) \leq \max \{\Delta(G)+2,10\} .
$$

Theorem 4. Let $G$ be a planar graph without 5 -cycles and without adjacent $\Delta(G)$-vertices. Then $\chi_{\Sigma}^{\prime \prime}(G) \leq \max \{\Delta(G)+1,10\}$.

Clearly, $\chi_{\Sigma}^{\prime \prime}(G) \geq \Delta(G)+1$ for any graph $G$. If $G$ has adjacent $\Delta(G)$-vertices, then $\chi_{\Sigma}^{\prime \prime}(G) \geq \Delta(G)+2$. Thus we get the following corollary.

Corollary 5. Let $G$ be a planar graph without 5 -cycles and $\Delta(G) \geq 9$. If $G$ has no adjacent $\Delta(G)$-vertices, then $\chi_{\Sigma}^{\prime \prime}(G)=\Delta(G)+1$, otherwise $\chi_{\Sigma}^{\prime \prime}(G)=\Delta(G)+2$.

## 2. The Proof of Theorem 3

We will prove it by contradiction. Let $G$ be a minimum counterexample to Theorem 3 which is embedded in the plane. Set $k=\max \{\Delta(G)+2,10\}$. By the choice of $G$, any planar graph $G^{\prime}$ without 5 -cycles which is smaller than $G$ has a $k$-tnsd-coloring $\phi^{\prime}$. In the following, we will choose some $G^{\prime}$ and extend the coloring $\phi^{\prime}$ of $G^{\prime}$ to a desired coloring $\phi$ of $G$ to get a contradiction. Unless otherwise stated, for any $x \in(V(G) \cup E(G)) \cap\left(V\left(G^{\prime}\right) \cup E\left(G^{\prime}\right)\right)$, set $\phi(x)=\phi^{\prime}(x)$.

In the following proof, we will omit the coloring of all $3^{-}$-vertices. Since they have at most 9 forbidden colors and $k \geq 10$, they can be colored easily.

In Figure 1, we draw a vertex $x$ in black if it has no other neighbors than the ones already depicted, and a vertex $x$ in white if it might have more neighbors than the ones shown in the figure.

Claim 1. These configurations of $F_{1}, F_{2}, F_{3}$ and $F_{4}$ in Figure 1 are reducible.
Proof. (1) Suppose to the contrary that $G$ contains configuration $F_{1}$. We obtain a smaller graph $G^{\prime}$ by splitting $v_{i}$ into $u_{i}, v_{i}$ for $i=1,2$ (see $F_{1}^{\prime}$ in Figure 1). Thus $G^{\prime}$ is a planar graph without 5 -cycles which is smaller than $G$. Hence $G^{\prime}$ admits a $k$-tnsd-coloring $\phi^{\prime}$. We can stick $u_{i}, v_{i}$ together properly for $i=1,2$ (if necessary, exchange the colors of $u u_{1}$ and $u u_{2}$ ), and then recolor $u_{i}, v_{i}$, thus we can obtain a $k$-tnsd-coloring $\phi$ of $G$, a contradiction.
(2) Suppose to the contrary that $G$ contains configuration $F_{2}$. We obtain a smaller graph $G^{\prime}$ by splitting $v_{i}$ into $u_{i}, v_{i}$ for $i=1,2$ (see $F_{2}^{\prime}$ in Figure 1 ) without producing 5 -cycles. Thus $G^{\prime}$ has a $k$-tnsd-coloring $\phi^{\prime}$.
(i) If $\phi^{\prime}\left(w u_{1}\right) \neq \phi^{\prime}\left(u u_{2}\right)$ or $\phi^{\prime}\left(w u_{1}\right)=\phi^{\prime}\left(u u_{2}\right) \notin\left\{\phi^{\prime}\left(v v_{1}\right), \phi^{\prime}\left(v v_{2}\right)\right\}$, then we can stick $u_{i}, v_{i}$ together for $i=1,2$ (if necessary, exchange the colors of $v v_{1}$ and $v v_{2}$ ).
(ii) If $\phi^{\prime}\left(w u_{1}\right)=\phi^{\prime}\left(u u_{2}\right) \in\left\{\phi^{\prime}\left(v v_{1}\right), \phi^{\prime}\left(v v_{2}\right)\right\}$, without loss of generality, suppose that $\phi^{\prime}\left(u u_{2}\right)=\phi^{\prime}\left(v v_{1}\right)$. Exchange the colors of $v v_{1}\left(u u_{2}\right)$ and $u v$. Therefore, we can stick $u_{i}, v_{i}$ together for $i=1,2$. Thus, by recoloring, we can obtain a $k$-tnsd-coloring $\phi$ of $G$, a contradiction.

Figure 1. Illustration of Claim 1.
(3) Suppose to the contrary that $G$ contains configuration $F_{3}$. We obtain a smaller graph $G^{\prime}$ by splitting $v_{i}$ into $v_{i 1}, v_{i 2}$ for $i=1,3$ (see $F_{3}^{\prime}$ in Figure 1) without producing 5 -cycles. Thus $G^{\prime}$ has a $k$-tnsd-coloring $\phi^{\prime}$.
(i) If $\phi^{\prime}\left(u v_{12}\right) \neq \phi^{\prime}\left(w v_{32}\right)$ or $\phi^{\prime}\left(u v_{12}\right)=\phi^{\prime}\left(w v_{32}\right) \notin\left\{\phi^{\prime}\left(v v_{11}\right), \phi^{\prime}\left(v v_{31}\right)\right\}$, then we can stick $v_{i 1}, v_{i 2}$ together for $i=1,3$ (if necessary, exchange the colors of $v v_{11}$ and $\left.v v_{31}\right)$.
(ii) If $\phi^{\prime}\left(u v_{12}\right)=\phi^{\prime}\left(w v_{32}\right) \in\left\{\phi^{\prime}\left(v v_{11}\right), \phi^{\prime}\left(v v_{31}\right)\right\}$, without loss of generality, suppose that $\phi^{\prime}\left(u v_{12}\right)=\phi^{\prime}\left(v v_{11}\right)$. Then we exchange the colors of $u v_{12}$ and $u v_{2}$. Therefore, we can stick $v_{i 1}, v_{i 2}$ together for $i=1,3$. Thus, by recoloring, we can obtain a $k$-tnsd-coloring $\phi$ of $G$, a contradiction.
(4) Suppose to the contrary that $G$ contains configuration $F_{4}$. We obtain a smaller graph $G^{\prime}$ by splitting $v_{i}$ into $v_{i 1}, v_{i 2}$ for $i=1,4$ (see $F_{4}^{\prime}$ in Figure 1) without producing 5 -cycles. Thus $G^{\prime}$ admits a $k$-tnsd-coloring $\phi^{\prime}$.
(i) If $\phi^{\prime}\left(u v_{12}\right) \neq \phi^{\prime}\left(z v_{42}\right)$ or $\phi^{\prime}\left(u v_{12}\right)=\phi^{\prime}\left(z v_{42}\right) \notin\left\{\phi^{\prime}\left(v v_{11}\right), \phi^{\prime}\left(v v_{41}\right)\right\}$, then we can stick $v_{i 1}, v_{i 2}$ together for $i=1,4$ (if necessary, exchange the colors of $v v_{11}$ and $v v_{41}$ ).
(ii) If $\phi^{\prime}\left(u v_{12}\right)=\phi^{\prime}\left(z v_{42}\right) \in\left\{\phi^{\prime}\left(v v_{11}\right), \phi^{\prime}\left(v v_{41}\right)\right\}$, without loss of generality, suppose that $\phi^{\prime}\left(u v_{12}\right)=\phi^{\prime}\left(z v_{42}\right)=\phi^{\prime}\left(v v_{11}\right)$. Since $\phi^{\prime}\left(w v_{2}\right) \neq \phi^{\prime}\left(w v_{3}\right)$, suppose that $\phi^{\prime}\left(w v_{2}\right) \neq \phi^{\prime}\left(u v_{12}\right)$. We exchange the colors of $u v_{12}$ and $u v_{2}$. Therefore, we can stick $v_{i 1}, v_{i 2}$ together for $i=1,4$. Thus, by recoloring, we can obtain a $k$-tnsd-coloring $\phi$ of $G$, a contradiction.

It is easy to see that the following claim given in [16] also holds with the graph $G$ in our proof.
Claim 2 [16]. In the graph $G$, the following results holds.
(1) Each $t^{-}$-vertex is not adjacent to any $(7-t)^{-}$-vertex, where $t=4,5$.
(2) For each vertex $v \in V(G)$, if $d_{G}^{1}(v) \geq 1$, then $d_{G}^{2}(v)=0$; if $d_{G}^{1}(v) \geq 2$, then $d_{G}^{3}(v)=0$.
(3) If $d_{G}(v)=5$, then $d_{G}^{3}(v) \leq 1$.
(4) If $d_{G}(v)=6$, then $d_{G}^{3^{-}}(v) \leq 2$. Furthermore, if $d_{G}^{2-}(v) \geq 1$, then $d_{G}^{3-}(v) \leq 1$.
(5) If $d_{G}(v)=7$, then $d_{G}^{2-}(v) \leq 2$. Furthermore, if $d_{G}^{2-}(v) \geq 1$, then $d_{G}^{3-}(v) \leq 2$.
(6) If $d_{G}(v)=l(l \geq 8)$, then $d_{G}^{1}(v)<\left\lceil\frac{l}{2}\right\rceil$.
(7) If $d_{G}(v)=l(l \geq 8)$ and $d_{G}^{2}(v) \geq 1$, then $d_{G}^{2}(v)+d_{G}^{3}(v) \leq l-1$.
(8) Each 3 -face in $G$ is a $\left(2,6^{+}, 6^{+}\right)$-face, a $\left(3,5^{+}, 5^{+}\right)$-face or a $\left(4^{+}, 4^{+}, 5^{+}\right)$face.
Claim 3. Each 4 -face in $G$ is a $\left(2,6^{+}, 3^{+}, 6^{+}\right)$-face, a $\left(3,6^{+}, 3,6^{+}\right)$-face, a $\left(3,5^{+}, 4^{+}, 5^{+}\right)$-face or a $\left(4^{+}, 4^{+}, 4^{+}, 4^{+}\right)$-face.

Proof. Let $T=v_{1} v_{2} v_{3} v_{4} v_{1}$ be a 4 -face of $G$, and assume that $d_{G}\left(v_{1}\right) \leq d_{G}\left(v_{i}\right)$, where $i=2,3,4$. If $d_{G}\left(v_{1}\right)=2$, by Claim $2(1), d_{G}\left(v_{2}\right) \geq 6, d_{G}\left(v_{4}\right) \geq 6$. By Claim 1, $F_{1}$ is reducible, thus $T$ is a $\left(2,6^{+}, 3^{+}, 6^{+}\right)$-face. If $d_{G}\left(v_{1}\right)=d_{G}\left(v_{3}\right)=$ 3, by Claim 2(1) and Claim 2(3), $d_{G}\left(v_{2}\right) \geq 6$ and $d_{G}\left(v_{4}\right) \geq 6$, thus $T$ is a $\left(3,6^{+}, 3,6^{+}\right)$-face. If $d_{G}\left(v_{1}\right)=3$ and $d_{G}\left(v_{3}\right) \geq 4$, by Claim $2(1), d_{G}\left(v_{2}\right) \geq 5$ and $d_{G}\left(v_{4}\right) \geq 5$, thus $T$ is a $\left(3,5^{+}, 4^{+}, 5^{+}\right)$-face. If $d_{G}\left(v_{1}\right) \geq 4$ and $d_{G}\left(v_{3}\right) \geq 4$, by Claim 2(1), $d_{G}\left(v_{2}\right) \geq 4$ and $d_{G}\left(v_{4}\right) \geq 4$, thus $T$ is a $\left(4^{+}, 4^{+}, 4^{+}, 4^{+}\right)$-face.

Let $H$ be the graph obtained from $G$ by removing all 1-vertices. By Claims $1-3$, we have the following facts.
Fact 1. For the graph $H$, we have $\delta(H) \geq 2 ; d_{H}(v)=d_{G}(v)$, for $2 \leq d_{G}(v) \leq 5$. If $d_{G}(v) \geq 6$, then $d_{H}(v) \geq 5$.

## Fact 2.

(1) In the graph $H$, each $3^{-}$-vertex is not adjacent to any $4^{-}$-vertex.
(2) If $d_{H}(v)=5$, then $d_{H}^{2}(v)=0$ and $d_{H}^{3}(v) \leq 1$.
(3) If $d_{H}(v)=6$, then $d_{H}^{2}(v) \leq 1$; furthermore, if $d_{H}^{2}(v)=1$, then $d_{H}^{3}(v)=0$; if $d_{H}^{2}(v)=0$, then $d_{H}^{3}(v) \leq 2$.
(4) If $d_{H}(v)=7$, then $d_{H}^{2}(v) \leq 2$; furthermore, if $d_{H}^{2}(v)=2$, then $d_{H}^{3}(v)=0$; if $d_{H}^{2}(v)=1$, then $d_{H}^{3}(v) \leq 1$.
(5) If $d_{H}(v)=l(l \geq 8)$, then $d_{H}^{2}(v) \leq l-1$.

## Fact 3.

(1) Each 3 -face in $H$ is a $\left(2,6^{+}, 6^{+}\right)$-face, a $\left(3,5^{+}, 5^{+}\right)$-face or a $\left(4^{+}, 4^{+}, 5^{+}\right)$-face.
(2) Each 4 -face in $H$ is a $\left(2,6^{+}, 3^{+}, 6^{+}\right)$-face, a $\left(3,6^{+}, 3,6^{+}\right)$-face, a $\left(3,5^{+}, 4^{+}\right.$, $\left.5^{+}\right)$-face or a $\left(4^{+}, 4^{+}, 4^{+}, 4^{+}\right)$-face.
A $\left(2,6^{+}, 6^{+}\right)$-face or a $\left(3,5^{+}, 5^{+}\right)$-face is called a bad 3 -face. A $\left(4^{+}, 5^{+}, 5^{+}\right)$face is called a normal 3 -face. A $\left(2,6^{+}, 3,6^{+}\right)$-face or a $\left(3,6^{+}, 3,6^{+}\right)$-face is called a bad 4-face, and other 4-face is a normal 4-face. We use $n_{i}^{\prime}(v), n_{i}^{\prime \prime}(v)$ to denote the number of bad $i$-faces and the number of normal $i$-faces incident with $v$ in $H$, respectively, $i=3,4$.

Since $G$ has no 5 -cycles, we have the following fact.
Fact 4. These configurations are reducible to $H$ :
(1) a 5-face,
(2) a 3 -face adjacent to two 3 -faces,
(3) a 3 -face adjacent to a 4 -face, and they are sharing only one edge.

By Fact 4, we have the following fact.
Fact 5. If $d_{H}(v)=l$ and $n_{H}^{3}(v)>0$, then $n_{H}^{3}(v)+n_{H}^{4}(v) \leq l-2$.
By Euler's formula, we have

$$
\sum_{v \in V(H)}\left(2 d_{H}(v)-6\right)+\sum_{f \in F(H)}\left(d_{H}(f)-6\right)=-12
$$

We will use the discharging method to obtain a contradiction. First, we give an initial charge function: $w(v)=2 d_{H}(v)-6$ for each $v \in V(H) ; w(f)=d_{H}(f)-6$ for each $f \in F(H)$. Next, we will design some discharging rules. Let $w^{\prime}$ be the new charge after the discharging process. It suffices to show that $w^{\prime}(x) \geq 0$ for each $x \in V(H) \cup F(H)$, which leads to a contradiction.

In the following, a $k$-face means a $k$-face in $H$, the discharging rules are defined as follows.

R1 Every 2-vertex $v$ in $H$ takes 1 from each neighbor.
R2 Every 4-vertex $v$ in $H$ gives 1 to each incident 3-face, gives $\frac{1}{2}$ to each incident 4-face.

R3 Every $5^{+}$-vertex $v$ in $H$ gives $\frac{3}{2}$ to each incident bad 3-face, gives 1 to each incident normal 3-face.

R4 Every $5^{+}$-vertex $v$ in $H$ gives 1 to each incident bad 4 -face, gives $\frac{3}{4}$ to each incident normal 4 -face.

We will verify the new charge of each $x \in V(H) \cup F(H)$. In the following, we use $d(v), d_{i}(v), n_{i}(v)$ and $d(f)$ to denote $d_{H}(v), d_{H}^{i}(v), n_{H}^{i}(v)$ and $d_{H}(f)$, respectively. We first consider the new charge of each $f \in F(H)$.

- $d(f)=3$. If $f$ is a bad 3 -face, by R3, $w^{\prime}(f)=3-6+\frac{3}{2} \cdot 2=0$; otherwise, by R2 and R3, $w^{\prime}(f)=3-6+1 \cdot 3=0$.
- $d(f)=4$. If $f$ is a bad 4-face, by R4, $w^{\prime}(f)=4-6+1 \cdot 2=0$. If $f$ is a $\left(2,6^{+}, 4^{+}, 6^{+}\right)$-face or a $\left(3,5^{+}, 4^{+}, 5^{+}\right)$-face, by R2 and R4, $w^{\prime}(f) \geq 4-6+\frac{3}{4} \cdot 2+$ $\frac{1}{2}=0$. If $f$ is a $\left(4^{+}, 4^{+}, 4^{+}, 4^{+}\right)$-face, by R2 and R4, $w^{\prime}(f) \geq 4-6+\frac{1}{2} \cdot 4=0$.
- $d(f)=t(t \geq 6) . w^{\prime}(f)=w(f)=t-6 \geq 0$.

Next we will consider the new charge of each $v \in V(H)$.

- $d(v)=2$. By R1, $w^{\prime}(v)=2 \cdot 2-6+1 \cdot 2=0$.
- $d(v)=3$. No rule applies to $v, w^{\prime}(v)=2 \cdot 3-6=0$.
- $d(v)=4$. By Fact $2(1), d_{2}(v)=d_{3}(v)=0$. If $n_{3}(v)=0$, by R2, $w^{\prime}(v)=$ $2 \cdot 4-6-\frac{1}{2} \cdot n_{4}(v) \geq 2-\frac{1}{2} \cdot 4=0$. If $n_{3}(v)>0$, by Fact $5, n_{3}(v)+n_{4}(v) \leq 2$. By R2, $w^{\prime}(v)=2 \cdot 4-6-1 \cdot n_{3}(v)-\frac{1}{2} \cdot n_{4}(v) \geq 2-1 \cdot 2=0$.
- $d(v)=5$. By Fact $2(2), d_{2}(v)=0, d_{3}(v) \leq 1$, so we have $n_{3}^{\prime}(v) \leq 2$ and $n_{4}^{\prime}(v)=0$. If $n_{3}(v)=0$, by R4, $w^{\prime}(v)=2 \cdot 5-6-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 4-\frac{3}{4} \cdot 5=\frac{1}{4}>0$. If $n_{3}(v)>0$, by Fact $5, n_{3}(v)+n_{4}^{\prime \prime}(v) \leq 3$. By R3 and R4, $w^{\prime}(v)=2 \cdot 5-6-\frac{3}{2}$. $n_{3}^{\prime}(v)-1 \cdot n_{3}^{\prime \prime}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 4-\frac{3}{2} \cdot 2-1=0$.
- $d(v)=6$. By Fact $2(3), d_{2}(v) \leq 1$.
(a) $d_{2}(v)=1$. By Fact $2(3), d_{3}(v)=0$, so we have $n_{3}^{\prime}(v) \leq 1$ and $n_{4}^{\prime}(v)=0$. If $n_{3}(v)=0$, by R1 and R4, $w^{\prime}(v)=2 \cdot 6-6-d_{2}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 6-1-\frac{3}{4} \cdot 6=$ $\frac{1}{2}>0$. If $n_{3}(v)>0$, by Fact $5, n_{3}(v)+n_{4}^{\prime \prime}(v) \leq 4$. By R1, R3 and R4, $w^{\prime}(v)=2 \cdot 6-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}^{\prime}(v)-1 \cdot n_{3}^{\prime \prime}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 6-1-\frac{3}{2} \cdot 1-1 \cdot 3=\frac{1}{2}>0$.
(b) $d_{2}(v)=0$. If $n_{3}(v)=0$, by R4, $w^{\prime}(v) \geq 2 \cdot 6-6-1 \cdot n_{4}(v) \geq 6-1 \cdot 6=0$. If $n_{3}(v)>0$, by Fact 5, $n_{3}(v)+n_{4}(v) \leq 4$. By R3 and R4, $w^{\prime}(v) \geq 2 \cdot 6-6-\frac{3}{2}$. $n_{3}(v)-1 \cdot n_{4}(v) \geq 6-\frac{3}{2} \cdot 4=0$.
- $d(v)=7$. By Fact $2(4), d_{2}(v) \leq 2$.
(a) $d_{2}(v)=2$. By Fact $2(4), d_{3}(v)=0$. By Claim $1, F_{1}$ and $F_{2}$ are reducible, so we have $n_{3}^{\prime}(v)=n_{4}^{\prime}(v)=0$. If $n_{3}(v)=0$, by R1 and R4, $w^{\prime}(v)=2$. $7-6-d_{2}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 8-2-\frac{3}{4} \cdot 7=\frac{3}{4}>0$. If $n_{3}(v)>0$, by Fact $5, n_{3}(v)+n_{4}(v) \leq 5$. Noting that $n_{3}^{\prime}(v)=n_{4}^{\prime}(v)=0$, By R1, R3 and R4, $w^{\prime}(v)=2 \cdot 7-6-d_{2}(v)-1 \cdot n_{3}^{\prime \prime}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 8-2-1 \cdot 5>0$.
(b) $d_{2}(v) \leq 1$. If $n_{3}(v)=0$, by R1 and R4, $w^{\prime}(v) \geq 2 \cdot 7-6-d_{2}(v)-1 \cdot n_{4}(v) \geq$ $8-1-1 \cdot 7=0$. If $n_{3}(v)>0$, by Fact 4 and Fact 5, $n_{3}(v) \leq 4$ and $n_{3}(v)+n_{4}(v) \leq 5$. By R1, R3 and R4, $w^{\prime}(v) \geq 2 \cdot 7-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-1 \cdot n_{4}(v) \geq 8-1-\frac{3}{2} \cdot 4-1=0$.
- $d(v)=l(l \geq 8)$, by Fact $2(5), d_{2}(v) \leq l-1$.
(a) $d_{2}(v)=l-1$. By Claim $1, F_{1}$ and $F_{2}$ are reducible, so we have $n_{3}(v)=0$ and $n_{4}(v) \leq 2$. By R1 and $\mathrm{R} 4, w^{\prime}(v) \geq 2 l-6-d_{2}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-$ 1) $-1 \cdot 2=l-7>0$.
(b) $d_{2}(v)=l-2$.
(b1) $n_{3}(v)=0$. By Claim 1, $F_{1}$ is reducible, so we have $n_{4}(v) \leq 4$. By R1 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-2)-4=l-8 \geq 0$.
(b2) $n_{3}(v)>0$. By Claim $1, F_{1}$ and $F_{2}$ are reducible, and by Fact 4 , we have $n_{3}(v)=1$ and $n_{4}(v)=0$. By R1 and R3, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v) \geq$ $2 l-6-(l-2)-\frac{3}{2}=l-\frac{11}{2}>0$.
(c) $d_{2}(v)=l-3$.
(c1) $n_{3}(v)=0$. By Claim 1, $F_{1}$ is reducible, so we have $n_{4}(v) \leq 6$.
If $n_{4}(v)=6$, by Claim $1, F_{3}$ is reducible, so we have $n_{4}^{\prime}(v)=0$. By R1 and $\mathrm{R} 4, w^{\prime}(v)=2 l-6-d_{2}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v)=2 l-6-(l-3)-\frac{3}{4} \cdot 6=l-\frac{15}{2}>0$.

If $n_{4}(v) \leq 5$, by R1 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-$ $3)-1 \cdot 5=l-8 \geq 0$.
(c2) $n_{3}(v)>0$. By Claim 1, $F_{2}$ is reducible, so we have $n_{3}(v) \leq 2$. By Claim $1, F_{1}$ is reducible, and by Fact 4 , we have $n_{4}(v) \leq 2$. By R1, R3 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-3)-\frac{3}{2} \cdot 2-2=l-8 \geq 0$.
(d) $d_{2}(v)=l-4$.
$(\mathrm{d} 1) n_{3}(v)=0$. By Claim $1, F_{1}$ is reducible, so we have $n_{4}(v) \leq 8$.
$n_{4}(v)=i(i=7,8)$. By Claim 1, $F_{3}$ is reducible, so we have $n_{4}^{\prime}(v) \leq 8-i$. By R1 and R4, $w^{\prime}(v)=2 l-6-d_{2}(v)-1 \cdot n_{4}^{\prime}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 2 l-6-(l-4)-$ $1 \cdot(8-i)-\frac{3}{4} \cdot(i-(8-i))=l-4-\frac{i}{2} \geq 0$.
$n_{4}(v) \leq 6$. By R1 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-$ 4) $-1 \cdot 6=l-8 \geq 0$.
$(\mathrm{d} 2) n_{3}(v)>0$. By Claim $1, F_{2}$ is reducible, so each 2-neighbor of $v$ is not incident with a 3 -face. And note that each 3 -face is not adjacent to two 3 -faces, so we have $n_{3}(v) \leq 2$.
$n_{3}(v)=i(i=1,2)$. By Claim $1, F_{1}$ and $F_{2}$ are reducible, and note that each 3 -face is not adjacent to a 4 -face, we have $n_{4}(v) \leq 6-2 i$. By R1, R3 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-4)-\frac{3}{2} \cdot i-1 \cdot(6-2 i)=$ $l-8+\frac{i}{2}>0$.
(e) $d_{2}(v)=l-5$.
(e1) $n_{3}(v)=0$. If $n_{4}(v) \leq l-1$, by R1 and $\mathrm{R} 4, w^{\prime}(v) \geq 2 l-6-d_{2}(v)-1$. $n_{4}(v) \geq 2 l-6-(l-5)-1 \cdot(l-1)=0$. Now suppose that $n_{4}(v)=l$. By Claim $1, F_{1}$ is reducible, so we have $d_{2}(v) \leq\left\lfloor\frac{l}{2}\right\rfloor$. Noting that $d_{2}(v)=l-5$, we have $8 \leq l \leq 10$. By Claim $1, F_{1}, F_{3}$ and $F_{4}$ are reducible, so we have $n_{4}^{\prime}(v) \leq 4$. By R1 and R $4, w^{\prime}(v)=2 l-6-d_{2}(v)-1 \cdot n_{4}^{\prime}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq 2 l-6-(l-5)-1 \cdot 4-\frac{3}{4} \cdot(l-4)=$ $\frac{l}{4}-2 \geq 0$.
$(\mathrm{e} 2) n_{3}(v)>0$. By Claim $1, F_{2}$ is reducible, and by Fact 4 , we have $n_{3}(v) \leq 3$
$n_{3}(v)=3$. By Claim 1, $F_{1}$ is reducible, and by Fact 4, we have $n_{4}(v)=0$. By R 1 and $\mathrm{R} 3, w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v) \geq 2 l-6-(l-5)-\frac{3}{2} \cdot 3=l-\frac{11}{2}>0$. $n_{3}(v)=i(i=1,2)$. By Claim 1, $F_{1}$ is reducible, and by Fact 4, we have $n_{4}(v) \leq 8-2 i$. By Claim 1, $F_{3}$ is reducible. So if $n_{4}(v)=8-2 i$, we have $n_{4}^{\prime}(v)=0$. By R1, R3 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-\frac{3}{4} \cdot n_{4}^{\prime \prime}(v) \geq$ $2 l-6-(l-5)-\frac{3}{2} \cdot i-\frac{3}{4} \cdot(8-2 i)=l-7>0$. If $n_{4}(v) \leq 7-2 i$, by R1, R 3 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-1 \cdot n_{4}(v) \geq 2 l-6-(l-5)-\frac{3}{2} \cdot i-1 \cdot(7-2 i)=$ $l+\frac{i}{2}-8>0$.
(f) $d_{2}(v) \leq l-6$. Set $t=\left\lceil\frac{2\left(l-d_{2}(v)-1\right)}{3}\right\rceil$. By Claim $1, F_{2}$ is reducible, and by Fact 4, we have $n_{3}(v) \leq t, n_{4}(v) \leq l$ and if $n_{3}(v)>0$, then $n_{3}(v)+n_{4}(v) \leq l-2$.
(f1) $n_{3}(v)=0$, by R1 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-l \geq 2 l-6-(l-6)-l=0$.
$(f 2) n_{3}(v)>0$, by R1, R3 and R4, $w^{\prime}(v) \geq 2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-n_{4}(v) \geq$ $2 l-6-d_{2}(v)-\frac{3}{2} \cdot n_{3}(v)-\left(l-2-n_{3}(v)\right) \geq l-4-d_{2}(v)-\frac{1}{2} \cdot t=l-4-d_{2}(v)-$ $\frac{1}{2}\left\lceil\frac{2\left(l-d_{2}(v)-1\right)}{3}\right\rceil \geq 0$.

Now we get that for each $x \in V(H) \cup F(H), w^{\prime}(x) \geq 0$, which is a contradiction. This completes the proof of Theorem 3.

## 3. The Proof of Theorem 4

The proof of Theorem 4 is almost the same as the proof of Theorem 3 except for some details. Let $G$ be a minimum counterexample to Theorem 4 which is embedded in the plane. Set $k=\max \{\Delta(G)+1,10\}$. By the choice of $G$, any planar graph $G^{\prime}$ without 5 -cycles and without adjacent $\Delta(G)$-vertices which is smaller than $G$ has a $k$-tnsd-coloring $\phi^{\prime}$. Similarly, we will choose some $G^{\prime}$ and extend the coloring $\phi^{\prime}$ of $G^{\prime}$ to a desired coloring $\phi$ of $G$ to get a contradiction. It is easy to see that all the claims in the proof of Theorem 3 except for Claim 2(6) and Claim 2(7) also hold here. The proof of Claim 2(6) and Claim 2(7) can be seen in [5]. The rest of the proof including the discharging method is the same as the proof of Theorem 3.
