#### Abstract

For a graph $G$ an edge-covering of $G$ is a family of subgraphs $H_{1}, H_{2}, \ldots$, $H_{t}$ such that each edge of $E(G)$ belongs to at least one of the subgraphs $H_{i}$, $i=1,2, \ldots, t$. In this case we say that $G$ admits an $\left(H_{1}, H_{2}, \ldots, H_{t}\right)$-(edge) covering. An $H$-covering of graph $G$ is an $\left(H_{1}, H_{2}, \ldots, H_{t}\right)$-(edge) covering in which every subgraph $H_{i}$ is isomorphic to a given graph $H$.

Let $G$ be a graph admitting $H$-covering. An edge $k$-labeling $\alpha: E(G) \rightarrow$ $\{1,2, \ldots, k\}$ is called an $H$-irregular edge $k$-labeling of the graph $G$ if for every two different subgraphs $H^{\prime}$ and $H^{\prime \prime}$ isomorphic to $H$ their weights

[^0]$w t_{\alpha}\left(H^{\prime}\right)$ and $w t_{\alpha}\left(H^{\prime \prime}\right)$ are distinct. The weight of a subgraph $H$ under an edge $k$-labeling $\alpha$ is the sum of labels of edges belonging to $H$. The edge $H$-irregularity strength of a graph $G$, denoted by $\operatorname{ehs}(G, H)$, is the smallest integer $k$ such that $G$ has an $H$-irregular edge $k$-labeling.

In this paper we determine the exact values of ehs $(G, H)$ for prisms, antiprisms, triangular ladders, diagonal ladders, wheels and gear graphs. Moreover the subgraph $H$ is isomorphic to only $C_{4}, C_{3}$ and $K_{4}$.
Keywords: $H$-irregular edge labeling, edge $H$-irregularity strength, prism, antiprism, triangular ladder, diagonal ladder, wheel, gear graph.
2010 Mathematics Subject Classification: 05C78, 05C70.

## 1. Introduction

Consider a simple and finite graph $G=(V, E)$ of order at least 2. An edge $k$-labeling is a function $\alpha: E(G) \rightarrow\{1,2, \ldots, k\}$, where $k$ is a positive integer. Then the associated weight of a vertex $x \in V(G)$ is $w_{\alpha}(x)=\sum_{x y \in E(G)} \alpha(x y)$, where the sum is taken over all edges incident to $x$. Such a labeling $\alpha$ is called irregular if the obtained weights of all vertices are different. The smallest positive integer $k$ for which there exists an irregular labeling of $G$ is called the irregularity strength of $G$ and is denoted by $\mathrm{s}(G)$. If it does not exist, then we write $\mathrm{s}(\mathrm{G})=\infty$. One can easily see that $\mathrm{s}(\mathrm{G})<\infty$ if and only if $G$ contains no isolated edges and has at most one isolated vertex.

The notion of the irregularity strength was firstly introduced by Chartrand et al. in [7]. Some results on the irregularity strength can be found in $[2,3,5,6$, $8,9,11-14]$.

A vertex $k$-labeling $\beta: V(G) \rightarrow\{1,2, \ldots, k\}$ is called an edge irregular $k$ labeling of the graph $G$ if the weights $w_{\beta}(x y) \neq w_{\beta}\left(x^{\prime} y^{\prime}\right)$ for every two distinct edges $x y$ and $x^{\prime} y^{\prime}$, where the weight of an edge $x y \in E(G)$ is $w_{\beta}(x y)=\beta(x)+\beta(y)$. The minimum $k$ for which a graph $G$ admits an edge irregular $k$-labeling is called the edge irregularity strength of $G$, denoted by es $(G)$. The notion of the edge irregularity strength was defined by Ahmad et al. in [1].

A family of subgraphs $H_{1}, H_{2}, \ldots, H_{t}$ is said to be an edge-covering of $G$ if each edge of $E(G)$ belongs to at least one of the subgraphs $H_{i}, i=1,2, \ldots, t$. In this case we say that $G$ admits an $\left(H_{1}, H_{2}, \ldots, H_{t}\right)$-(edge) covering. If every subgraph $H_{i}, i=1,2, \ldots, t$, is isomorphic to a given graph $H$, then the graph $G$ admits an $H$-covering.

Motivated by the irregularity strength and the edge irregularity strength of a graph $G$ Ashraf et al. in [4] introduced a new parameter, edge $H$-irregularity strength, as a natural extension of the parameters $\mathrm{s}(G)$ and es $(G)$. Let $G$ be a graph admitting $H$-covering. An edge $k$-labeling $\alpha$ is called an $H$-irregular
edge $k$-labeling of the graph $G$ if for every two different subgraphs $H^{\prime}$ and $H^{\prime \prime}$ isomorphic to $H$ we have

$$
w t_{\alpha}\left(H^{\prime}\right)=\sum_{e \in E\left(H^{\prime}\right)} \alpha(e) \neq \sum_{e \in E\left(H^{\prime \prime}\right)} \alpha(e)=w t_{\alpha}\left(H^{\prime \prime}\right)
$$

The edge $H$-irregularity strength of a graph $G$, denoted by ehs $(G, H)$, is the smallest integer $k$ for which $G$ has an $H$-irregular edge $k$-labeling.

Next theorem proved in [4] gives the lower bound of the edge $H$-irregularity strength of a graph $G$.

Theorem 1 [4]. Let $G$ be a graph admitting an $H$-covering and $t$ is the number of all the subgraphs isomorphic to $H$. Then

$$
\operatorname{ehs}(G, H) \geq\left\lceil 1+\frac{t-1}{|E(H)|}\right\rceil
$$

Note that the parameter $t$ is the number of all subgraphs of $G$ isomorphic to $H$. In this paper we determine exact values of the edge $H$-irregularity strength for prisms, antiprisms, triangular ladders, diagonal ladders, wheels and gear graphs for some $H$. Moreover the subgraph $H$ is isomorphic to only $C_{4}, C_{3}$ and $K_{4}$.

## 2. Prism and Antiprism

The prism $D_{n}$ can be defined as the Cartesian product $C_{n} \square P_{2}$ of a cycle on $n$ vertices with a path on 2 vertices. Let $V\left(C_{n} \square P_{2}\right)=\left\{x_{i}, y_{i}: 1 \leq i \leq n\right\}$ be the vertex set and $E\left(C_{n} \square P_{2}\right)=\left\{x_{i} x_{i+1}, y_{i} y_{i+1}: 1 \leq i \leq n\right\} \cup\left\{x_{i} y_{i}: 1 \leq i \leq n\right\}$ be the edge set, where the indices are taken modulo $n$. Hence, the graph $D_{n}$ has $2 n$ vertices and $3 n$ edges.

Theorem 2. Let $D_{n}=C_{n} \square P_{2}, n \geq 3, n \neq 4$, be a prism. Then

$$
\operatorname{ehs}\left(D_{n}, C_{4}\right)=\left\lceil\frac{n+3}{4}\right\rceil
$$

Proof. The prism $D_{n}, n \geq 3, n \neq 4$, admits a $C_{4}$-covering with exactly $n$ cycles $C_{4}$. We denote these 4 -cycles by the symbols $C_{4}^{i}, i=1,2, \ldots, n$, such that the vertex set of $C_{4}^{i}$ is $V\left(C_{4}^{i}\right)=\left\{x_{i}, x_{i+1}, y_{i}, y_{i+1}\right\}$ and the edge set is $E\left(C_{4}^{i}\right)=$ $\left\{x_{i} x_{i+1}, y_{i} y_{i+1}, x_{i} y_{i}, x_{i+1} y_{i+1}\right\}$.

From Theorem 1 it follows that ehs $\left(D_{n}, C_{4}\right) \geq\left\lceil\frac{n+3}{4}\right\rceil$. To show that $\left\lceil\frac{n+3}{4}\right\rceil$ is an upper bound for the edge $C_{4}$-irregularity strength of $D_{n}$ we define a $C_{4}{ }^{-}$ irregular edge labeling $\alpha_{1}: E\left(D_{n}\right) \rightarrow\left\{1,2, \ldots,\left\lceil\frac{n+3}{4}\right\rceil\right\}$, in the following way. We distinguish to cases according to the parity of $n$.

Case 1. When $n$ is odd, then

$$
\begin{aligned}
\alpha_{1}\left(x_{i} x_{i+1}\right) & = \begin{cases}\left\lceil\frac{i}{2}\right\rceil & \text { for } 1 \leq i \leq \frac{n+1}{2}, \\
\left\lceil\frac{n+1-i}{2}\right\rceil & \text { for } \frac{n+1}{2}+1 \leq i \leq n,\end{cases} \\
\alpha_{1}\left(y_{i} y_{i+1}\right) & = \begin{cases}\left\lceil\frac{i+1}{2}\right\rceil & \text { for } 1 \leq i \leq \frac{n+1}{2}, \\
\left\lceil\frac{n+2-i}{2}\right\rceil & \text { for } \frac{n+1}{2}+1 \leq i \leq n,\end{cases} \\
\alpha_{1}\left(x_{i} y_{i}\right) & = \begin{cases}\left\lceil\frac{i}{2}\right\rceil & \text { for } 1 \leq i \leq \frac{n+1}{2}, \\
\left\lceil\frac{n+3-i}{2}\right\rceil & \text { for } \frac{n+1}{2}+1 \leq i \leq n .\end{cases}
\end{aligned}
$$

Case 2. When $n$ is even, then

$$
\begin{aligned}
& \alpha_{1}\left(x_{i} x_{i+1}\right)= \begin{cases}\left\lceil\frac{i}{2}\right\rceil & \text { for } 1 \leq i \leq \frac{n}{2}, \\
\left\lceil\frac{n+1-i}{2}\right\rceil & \text { for } \frac{n}{2}+1 \leq i \leq n,\end{cases} \\
& \alpha_{1}\left(y_{i} y_{i+1}\right)= \begin{cases}\left\lceil\frac{i+1}{2}\right\rceil & \text { for } 1 \leq i \leq \frac{n}{2}, \\
\left\lceil\frac{n+3}{4}\right\rceil & \text { for } i=\frac{n}{2}+1, \\
\left\lceil\frac{n+2-i}{2}\right\rceil & \text { for } \frac{n}{2}+2 \leq i \leq n,\end{cases} \\
& \alpha_{1}\left(x_{i} y_{i}\right)= \begin{cases}\left\lceil\frac{i}{2}\right\rceil & \text { for } 1 \leq i \leq \frac{n}{2}, \\
\frac{n}{4}+1 & \text { for } i=\frac{n}{2}+1 \text { and } n \equiv 0(\bmod 4), \\
\frac{n+2}{4} & \text { for } i=\frac{n}{2}+1 \text { and } n \equiv 2(\bmod 4), \\
\left\lceil\frac{n+3-i}{2}\right\rceil & \text { for } \frac{n}{2}+2 \leq i \leq n .\end{cases}
\end{aligned}
$$

It is easy to see that under the labeling $\alpha_{1}$ all edge labels are at most $\left\lceil\frac{n+3}{4}\right\rceil$. The $C_{4}$-weights of the cycles $C_{4}^{i}, i=1,2, \ldots, n$, under the edge labeling $\alpha_{1}$, are given by

$$
w t_{\alpha_{1}}\left(C_{4}^{i}\right)=\sum_{e \in E\left(C_{4}^{i}\right)} \alpha_{1}(e)=\alpha_{1}\left(x_{i} x_{i+1}\right)+\alpha_{1}\left(y_{i} y_{i+1}\right)+\alpha_{1}\left(x_{i} y_{i}\right)+\alpha_{1}\left(x_{i+1} y_{i+1}\right) .
$$

Case 1. When $n$ is odd, then

$$
\begin{aligned}
w t_{\alpha_{1}}\left(C_{4}^{i}\right)= & \left\lceil\frac{i}{2}\right\rceil+\left\lceil\frac{i+1}{2}\right\rceil+\left\lceil\frac{i}{2}\right\rceil+\left\lceil\frac{i+1}{2}\right\rceil=2 i+2 \quad \text { for } 1 \leq i \leq \frac{n-1}{2} \\
w t_{\alpha_{1}}\left(C_{4}^{\frac{n+1}{2}}\right)= & \left\lceil\frac{n+1}{4}\right\rceil+\left\lceil\frac{n+3}{4}\right\rceil+\left\lceil\frac{n+1}{4}\right\rceil+\left\lceil\frac{n+3}{4}\right\rceil=n+3, \\
w t_{\alpha_{1}}\left(C_{4}^{i}\right)= & \left\lceil\frac{n+1-i}{2}\right\rceil+\left\lceil\frac{n+2-i}{2}\right\rceil+\left\lceil\frac{n+3-i}{2}\right\rceil+\left\lceil\frac{n+2-i}{2}\right\rceil=2 n+5-2 i \\
& \text { for } \frac{n+1}{2}+1 \leq i \leq n-1, \\
w t_{\alpha_{1}}\left(C_{4}^{n}\right)= & \left\lceil\frac{1}{2}\right\rceil+\left\lceil\frac{2}{2}\right\rceil+\left\lceil\frac{3}{2}\right\rceil+\left\lceil\frac{1}{2}\right\rceil=5 .
\end{aligned}
$$

Case 2. When $n$ is even, then

$$
\begin{aligned}
& w t_{\alpha_{1}}\left(C_{4}^{i}\right)=\left\lceil\frac{i}{2}\right\rceil+\left\lceil\frac{i+1}{2}\right\rceil+\left\lceil\frac{i}{2}\right\rceil+\left\lceil\frac{i+1}{2}\right\rceil=2 i+2 \quad \text { for } 1 \leq i \leq \frac{n}{2}-1, \\
& w t_{\alpha_{1}}\left(C_{4}^{\frac{n}{2}}\right)=\left\lceil\frac{n}{4}\right\rceil+\left\lceil\frac{n+2}{4}\right\rceil+\left\lceil\frac{n}{4}\right\rceil+\frac{n}{4}+1=n+2 \quad \text { for } n \equiv 0(\bmod 4), \\
& w t_{\alpha_{1}}\left(C_{4}^{\frac{n}{2}}\right)=\left\lceil\frac{n}{4}\right\rceil+\left\lceil\frac{n+2}{4}\right\rceil+\left\lceil\frac{n}{4}\right\rceil+\frac{n+2}{4}=n+2 \quad \text { for } n \equiv 2(\bmod 4), \\
& w t_{\alpha_{1}}\left(C_{4}^{\frac{n}{2}+1}\right)=\left\lceil\frac{n}{4}\right\rceil+\left\lceil\frac{n+3}{4}\right\rceil+\left\lceil\frac{n}{4}\right\rceil+1+\frac{n}{4}+1=n+3 \quad \text { for } n \equiv 0(\bmod 4), \\
& w t_{\alpha_{1}}\left(C_{4}^{\frac{n}{2}+1}\right)=\left\lceil\frac{n}{4}\right\rceil+\left\lceil\frac{n+3}{4}\right\rceil+\left\lceil\frac{n+2}{4}\right\rceil+\frac{n+2}{4}=n+3 \quad \text { for } n \equiv 2(\bmod 4), \\
& w t_{\alpha_{1}}\left(C_{4}^{i}\right)=\left\lceil\frac{n+1-i}{2}\right\rceil+\left\lceil\frac{n+2-i}{2}\right\rceil+\left\lceil\frac{n+3-i}{2}\right\rceil+\left\lceil\frac{n+2-i}{2}\right\rceil=2 n+5-2 i \\
& \text { for } \frac{n}{2}+2 \leq i \leq n-1, \\
& w t_{\alpha_{1}}\left(C_{4}^{n}\right)=\left\lceil\frac{1}{2}\right\rceil+\left\lceil\frac{2}{2}\right\rceil+\left\lceil\frac{3}{2}\right\rceil+\left\lceil\frac{1}{2}\right\rceil=5 .
\end{aligned}
$$

Combining the previous we get that

$$
w t_{\alpha_{1}}\left(C_{4}^{i}\right)= \begin{cases}2(1+i) & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil \\ 1+2(n+2-i) & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n\end{cases}
$$

One can see that the weights of cycles $C_{4}^{i}$, for $i=1,2, \ldots,\left\lceil\frac{n}{2}\right\rceil$, are even and in increasing order, therefore $w t_{\alpha_{1}}\left(C_{4}^{i+1}\right)>w t_{\alpha_{1}}\left(C_{4}^{i}\right)$.

On the other hand, the weights of cycles $C_{4}^{i}$, for $i=\left\lceil\frac{n}{2}\right\rceil+1, \ldots, n$, are odd and in decreasing order, therefore $w t_{\alpha_{1}}\left(C_{4}^{i+1}\right)<w t_{\alpha_{1}}\left(C_{4}^{i}\right)$.

Thus the edge weights are distinct numbers from the set $\{4,5, \ldots, n+3\}$. This shows that ehs $\left(D_{n}, C_{4}\right) \leq\left\lceil\frac{n+3}{4}\right\rceil$. Hence the proof is concluded.

The antiprism $A_{n}[10], n \geq 3$, is a 4 -regular graph (Archimedean convex polytope), consisting of $2 n$ vertices and $4 n$ edges. The vertex and edge set of $A_{n}$ are defined as: $V\left(A_{n}\right)=\left\{x_{i}, y_{i}: 1 \leq i \leq n\right\}, E\left(A_{n}\right)=\left\{x_{i} y_{i}: 1 \leq i \leq\right.$ $n\} \cup\left\{x_{i} x_{i+1}: 1 \leq i \leq n\right\} \cup\left\{y_{i} x_{i+1}: 1 \leq i \leq n\right\} \cup\left\{y_{i} y_{i+1}: 1 \leq i \leq n\right\}$, with indices taken modulo $n$.

Theorem 3. Let $A_{n}, n \geq 4$, be an antiprism. Then

$$
\operatorname{ehs}\left(A_{n}, C_{3}\right)=\left\lceil\frac{2 n+2}{3}\right\rceil .
$$

Proof. The antiprism $A_{n}, n \geq 4$, admits a $C_{3}$-covering with exactly $2 n$ cycles $C_{3}$. The first type of the cycle $C_{3}$ has the vertex set $V\left(C_{3}^{i}\right)=\left\{x_{i}, x_{i+1}, y_{i}: 1 \leq i \leq n\right\}$ and the edge set $E\left(C_{3}^{i}\right)=\left\{x_{i} x_{i+1}, x_{i} y_{i}, y_{i} x_{i+1}: 1 \leq i \leq n\right\}$. The second type
of the cycle $C_{3}$ has the vertex set $V\left(\mathcal{C}_{3}^{i}\right)=\left\{y_{i}, y_{i+1}, x_{i+1}: 1 \leq i \leq n\right\}$ and the edge set $E\left(\mathcal{C}_{3}^{i}\right)=\left\{y_{i} y_{i+1}, y_{i} x_{i+1}, y_{i+1} x_{i+1}: 1 \leq i \leq n\right\}$. Note that the indices are taken modulo $n$.

From Theorem 1 it follows that $\operatorname{ehs}\left(A_{n}, C_{3}\right) \geq\left\lceil\frac{2 n+2}{3}\right\rceil$. To show that $\left\lceil\frac{2 n+2}{3}\right\rceil$ is an upper bound for the edge $C_{3}$-irregularity strength of $A_{n}$ we define a $C_{3}$ irregular edge labeling $\alpha_{2}: E\left(A_{n}\right) \rightarrow\left\{1,2, \ldots,\left\lceil\frac{2 n+2}{3}\right\rceil\right\}$, in the following way. We distinguish two cases.

Case 1. When $n \equiv 0,4,5(\bmod 6)$, then

$$
\alpha_{2}\left(x_{i} x_{i+1}\right)= \begin{cases}i & \text { for } i=1,2 \\ i+\left\lfloor\frac{i}{3}\right\rfloor & \text { for } 3 \leq i \leq t-1 \\ \left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=t \\ n-i+3+\left\lfloor\frac{n-i-2}{3}\right\rfloor & \text { for } t+1 \leq i \leq n-2 \\ n-i+2 & \text { for } i=n-1, n\end{cases}
$$

where $t= \begin{cases}\frac{n+1}{2} & \text { if } n \equiv 5(\bmod 6), \\ \frac{n}{2}+1 & \text { if } n \equiv 0,4(\bmod 6) .\end{cases}$

$$
\begin{gathered}
\alpha_{2}\left(y_{i} y_{i+1}\right)= \begin{cases}i+1+\left\lfloor\frac{i-1}{3}\right\rfloor & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil-1, \\
\left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \equiv 5(\bmod 6), \\
\left\lceil\frac{2 n+2}{3}\right\rceil-1 & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \equiv 0,4(\bmod 6), \\
n-i+2+\left\lfloor\frac{n-i-1}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n-1, \\
1 & \text { for } i=n,\end{cases} \\
\alpha_{2}\left(x_{i} y_{i}\right)= \begin{cases}i+\left\lfloor\frac{i-1}{3}\right\rfloor & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil, \\
\left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil+1 \text { and } n \equiv 0,5(\bmod 6), \\
\left\lceil\frac{2 n+2}{3}\right\rceil-1 & \text { for } i=\left\lceil\frac{n}{2}\right\rceil+1 \text { and } n \equiv 4(\bmod 6), \\
n-i+3+\left\lfloor\frac{n-i-1}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+2 \leq i \leq n-1, \\
2 & \text { for } i=n,\end{cases} \\
\alpha_{2}\left(y_{i} x_{i+1}\right)= \begin{cases}1 & \text { for } i=1, \\
i+1+\left\lfloor\frac{i-2}{3}\right\rfloor & \text { for } 2 \leq i \leq\left\lceil\frac{n}{2}\right\rceil-1, \\
\left\lceil\frac{2 n+2}{3}\right\rceil-1 & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \equiv 0,4(\bmod 6), \\
\left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \equiv 5(\bmod 6), \\
n-i+2+\left\lfloor\frac{n-i}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n .\end{cases}
\end{gathered}
$$

Case 2. When $n \equiv 1,2,3(\bmod 6)$, then

$$
\alpha_{2}\left(x_{i} x_{i+1}\right)= \begin{cases}i & \text { for } i=1,2 \\ i+\left\lfloor\frac{i}{3}\right\rfloor & \text { for } 3 \leq i \leq t-1 \\ \left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=t \text { and } n \equiv 2(\bmod 6) \\ \left\lceil\frac{2 n+2}{3}\right\rceil-1 & \text { for } i=t \text { and } n \equiv 1,3(\bmod 6) \\ n-i+3+\left\lfloor\frac{n-i-2}{3}\right\rfloor & \text { for } t+1 \leq i \leq n-2 \\ n-i+2 & \text { for } i=n-1, n\end{cases}
$$

where $t= \begin{cases}\frac{n+1}{2} & \text { if } n \equiv 1,3(\bmod 6), \\ \frac{n}{2}+1 & \text { if } n \equiv 2(\bmod 6) .\end{cases}$

$$
\begin{aligned}
& \alpha_{2}\left(y_{i} y_{i+1}\right)= \begin{cases}i+1+\left\lfloor\frac{i-1}{3}\right\rfloor & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil-1, \\
\left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil, \\
n-i+2+\left\lfloor\frac{n-i-1}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n-1, \\
1 & \text { for } i=n,\end{cases} \\
& \alpha_{2}\left(x_{i} y_{i}\right)= \begin{cases}i+\left\lfloor\frac{i-1}{3}\right\rfloor & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil, \\
\left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil+1 \text { and } n \equiv 2(\bmod 6), \\
\left\lceil\frac{2 n+2}{3}\right\rceil-1 & \text { for } i=\left\lceil\frac{n}{2}\right\rceil+1 \text { and } n \equiv 1,3(\bmod 6), \\
n-i+3+\left\lfloor\frac{n-i-1}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+2 \leq i \leq n-1, \\
2 & \text { for } i=n,\end{cases} \\
& \alpha_{2}\left(y_{i} x_{i+1}\right)= \begin{cases}1 & \text { for } i=1, \\
i+1+\left\lfloor\frac{i-2}{3}\right\rfloor & \text { for } 2 \leq i \leq\left\lceil\frac{n}{2}\right\rceil-1, \\
\left\lceil\frac{2 n+2}{3}\right\rceil-1 & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \equiv 1,2(\bmod 6), \\
\left\lceil\frac{2 n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \equiv 3(\bmod 6), \\
n-i+2+\left\lfloor\frac{n-i}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n .\end{cases}
\end{aligned}
$$

Now we compute the $C_{3}$-weights under the edge labeling $\alpha_{2}$ as follows. For the weights of 3 -cycles of the first type we get

$$
\begin{aligned}
w t_{\alpha_{2}}\left(C_{3}^{i}\right) & =\sum_{e \in E\left(C_{3}^{i}\right)} \alpha_{2}(e)=\alpha_{2}\left(x_{i} x_{i+1}\right)+\alpha_{2}\left(x_{i} y_{i}\right)+\alpha_{2}\left(y_{i} x_{i+1}\right) \\
& = \begin{cases}4 i-1 & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil, \\
4 n-4 i+6 & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n,\end{cases}
\end{aligned}
$$

and for the weights of 3 -cycles of the second type we have

$$
\begin{aligned}
w t_{\alpha_{2}}\left(\mathcal{C}_{3}^{i}\right) & =\sum_{e \in E\left(\mathcal{C}_{3}^{i}\right)} \alpha_{2}(e)=\alpha_{2}\left(y_{i} y_{i+1}\right)+\alpha_{2}\left(y_{i} x_{i+1}\right)+\alpha_{2}\left(y_{i+1} x_{i+1}\right) \\
& = \begin{cases}4 i+1 & \text { for } 1 \leq i \leq\left\lceil\frac{n+1}{2}\right\rceil-1, \\
4 n-4 i+4 & \text { for }\left\lceil\frac{n+1}{2}\right\rceil \leq i \leq n .\end{cases}
\end{aligned}
$$

Combining these two cases one can see that the weights of the cycles $C_{3}^{i}$ are different to the weights of the cycles $\mathcal{C}_{3}^{i}$. This shows that $\alpha_{2}$ is an edge $C_{3}{ }^{-}$ irregular labeling of $A_{n}$. Therefore, ehs $\left(A_{n}, C_{4}\right) \leq\left\lceil\frac{2 n+2}{3}\right\rceil$ and we arrive at the desired result.

## 3. Triangular Ladder and Diagonal Ladder

Let $L_{n} \cong P_{n} \square P_{2}, n \geq 2$, be a ladder with the vertex set $V\left(L_{n}\right)=\left\{x_{i}, y_{i}: i=\right.$ $1,2, \ldots, n\}$ and the edge set $E\left(L_{n}\right)=\left\{x_{i} x_{i+1}, y_{i} y_{i+1}: i=1,2, \ldots, n-1\right\} \cup\left\{x_{i} y_{i}\right.$ : $i=1,2, \ldots, n\}$. The triangular ladder $T L_{n}, n \geq 2$, is obtained from a ladder $L_{n}$ by adding the edges $y_{i} x_{i+1}$ for $i=1,2, \ldots, n-1$.

Theorem 4. Let $T L_{n}, n \geq 2$, be a triangular ladder. Then

$$
\operatorname{ehs}\left(T L_{n}, C_{3}\right)=\left\lceil\frac{2 n}{3}\right\rceil
$$

Proof. The triangular ladder $T L_{n}, n \geq 2$, admits a $C_{3}$-covering with exactly $2(n-1)$ cycles $C_{3}$. There are two types of cycles $C_{3}$ that cover $T L_{n}$. The first type of cycles $C_{3}$ has the vertex set $V\left(C_{3}^{i}\right)=\left\{x_{i}, x_{i+1}, y_{i}: 1 \leq i \leq n-1\right\}$ and the edge set $E\left(C_{3}^{i}\right)=\left\{x_{i} x_{i+1}, x_{i} y_{i}, y_{i} x_{i+1}: 1 \leq i \leq n-1\right\}$. The second type of cycles $C_{3}$ has the vertex set $V\left(\mathcal{C}_{3}^{i}\right)=\left\{y_{i}, y_{i+1}, x_{i+1}: 1 \leq i \leq n-1\right\}$ and the edge set $E\left(\mathcal{C}_{3}^{i}\right)=\left\{y_{i} y_{i+1}, y_{i} x_{i+1}, y_{i+1} x_{i+1}: 1 \leq i \leq n-1\right\}$.

According to Theorem 1 it follows that ehs $\left(T L_{n}, C_{3}\right) \geq\left\lceil\frac{2 n}{3}\right\rceil$. To show that $\left\lceil\frac{2 n}{3}\right\rceil$ is an upper bound for the edge $C_{3}$-irregularity strength of $T L_{n}$ we define a $C_{3}$-irregular edge labeling $\alpha_{3}: E\left(T L_{n}\right) \rightarrow\left\{1,2, \ldots,\left\lceil\frac{2 n}{3}\right\rceil\right\}$ as follows. Let us consider three cases.

Case 1 . When $i \equiv 0(\bmod 3)$, then

$$
\begin{aligned}
\alpha_{3}\left(x_{i} x_{i+1}\right)=\alpha_{3}\left(y_{i} y_{i+1}\right) & =\frac{2 i}{3} & & \text { for } i=3,6, \ldots, n-1, \\
\alpha_{3}\left(y_{i} x_{i+1}\right) & =\frac{2 i+3}{3} & & \text { for } i=3,6, \ldots, n-1, \\
\alpha_{3}\left(x_{i} y_{i}\right) & =\frac{2 i}{3} & & \text { for } i=3,6, \ldots, n .
\end{aligned}
$$

Case 2 . When $i \equiv 1(\bmod 3)$, then

$$
\begin{aligned}
\alpha_{3}\left(x_{i} x_{i+1}\right)=\alpha_{3}\left(y_{i} y_{i+1}\right)=\alpha_{3}\left(y_{i} x_{i+1}\right) & =\frac{2 i+1}{3} \\
\alpha_{3}\left(x_{i} y_{i}\right) & =\frac{2 i+1}{3}
\end{aligned} \quad \text { for } i=1,4, \ldots, n-1, ~ \text { for } i=1,4, \ldots, n . ~ \$ ~
$$

Case 3. When $i \equiv 2(\bmod 3)$, then

$$
\begin{aligned}
\alpha_{3}\left(x_{i} x_{i+1}\right) & =\frac{2 i-1}{3} & & \text { for } i=2,5, \ldots, n-1, \\
\alpha_{3}\left(y_{i} y_{i+1}\right)=\alpha_{3}\left(y_{i} x_{i+1}\right) & =\frac{2 i+2}{3} & & \text { for } i=2,5, \ldots, n-1, \\
\alpha_{3}\left(x_{i} y_{i}\right) & =\frac{2 i+2}{3} & & \text { for } i=2,5, \ldots, n .
\end{aligned}
$$

It is a routine matter to verify that under the labeling $\alpha_{3}$ all edge labels are at most $\left\lceil\frac{2 n}{3}\right\rceil$. It is not difficult to see that under the edge labeling $\alpha_{3}$ the weights of the cycles $C_{3}^{i}, 1 \leq i \leq n-1$, are of the form

$$
w t_{\alpha_{3}}\left(C_{3}^{i}\right)=\alpha_{3}\left(x_{i} x_{i+1}\right)+\alpha_{3}\left(x_{i} y_{i}\right)+\alpha_{3}\left(y_{i} x_{i+1}\right)=2 i+1 .
$$

The weights of the cycles $\mathcal{C}_{3}^{i}, 1 \leq i \leq n-1$, are of the form

$$
w t_{\alpha_{3}}\left(\mathcal{C}_{3}^{i}\right)=\alpha_{3}\left(y_{i} y_{i+1}\right)+\alpha_{3}\left(x_{i+1} y_{i+1}\right)+\alpha_{3}\left(y_{i} x_{i+1}\right)=2(i+1) .
$$

Combining these two cases we obtained that the weights are different for any two distinct cycles $C_{3}$. Thus ehs $\left(T L_{n}, C_{3}\right) \leq\left\lceil\frac{2 n}{3}\right\rceil$. This completes the proof.

The diagonal ladder $D L_{n}$ is obtained from a ladder $L_{n}$ by adding the edges $\left\{x_{i} y_{i+1}, x_{i+1} y_{i}: 1 \leq i \leq n-1\right\}$. So the diagonal ladder $D L_{n}$ contains $2 n$ vertices and $5 n-4$ edges.

Theorem 5. Let $D L_{n}, n \geq 2$, be a diagonal ladder. Then

$$
\operatorname{ehs}\left(D L_{n}, K_{4}\right)=\left\lceil\frac{n+4}{6}\right\rceil .
$$

Proof. The diagonal ladder $D L_{n}, n \geq 2$, admits a $K_{4}$-covering with exactly ( $n-$ 1) complete graphs $K_{4}$. The $K_{4}^{i}$ has the vertex set $V\left(K_{4}^{i}\right)=\left\{x_{i}, y_{i}, x_{i+1}, y_{i+1}\right.$ : $1 \leq i \leq n-1\}$ and the edge set $E\left(K_{4}^{i}\right)=\left\{x_{i} x_{i+1}, x_{i} y_{i}, x_{i} y_{i+1}, y_{i} y_{i+1}, y_{i} x_{i+1}\right.$, $\left.x_{i+1} y_{i+1}: 1 \leq i \leq n-1\right\}$.

With respect to Theorem 1 it follows that $\operatorname{ehs}\left(D L_{n}, K_{4}\right) \geq\left\lceil\frac{n+4}{6}\right\rceil$. To show that ehs $\left(D L_{n}, K_{4}\right) \leq\left\lceil\frac{n+4}{6}\right\rceil$ we define a $K_{4}$-irregular edge labeling $\alpha_{4}$ :
$E\left(D L_{n}\right) \rightarrow\left\{1,2, \ldots,\left\lceil\frac{n+4}{6}\right\rceil\right\}$, in the following way.

$$
\begin{aligned}
& \alpha_{4}\left(y_{i} y_{i+1}\right)=\left\lceil\frac{i}{6}\right\rceil \\
& \alpha_{4}\left(x_{i} x_{i+1}\right) \text { for } 1 \leq i \leq n-1, \\
& \alpha_{4}\left(x_{i} y_{i}\right)= \begin{cases}\left\lceil\frac{i}{6}\right\rceil & \text { for } 1 \leq i \leq 5, \\
\left\lceil\frac{i+1}{6}\right\rceil & \text { for } 6 \leq i \leq n-1, \\
\left\lceil\frac{i+2}{6}\right\rceil & \text { for } 1 \leq i \leq 4,\end{cases} \\
& \text { for } 5 \leq i \leq n,
\end{aligned}, \begin{array}{lll} 
& \text { for } i=1,
\end{array}, \begin{array}{ll}
1 & \left(x_{i} y_{i+1}\right)
\end{array}= \begin{cases}\left\lceil\frac{i+5}{6}\right\rceil & \text { for } 2 \leq i \leq n-1, \\
\alpha_{4}\left(x_{i+1} y_{i}\right) & = \begin{cases}1 & \text { for } i=1,2, \\
\left\lceil\frac{i+4}{6}\right\rceil & \text { for } 3 \leq i \leq n-1 .\end{cases} \end{cases}
$$

One can verify that under the labeling $\alpha_{4}$ all edge labels are at least 1 and at most $\left\lceil\frac{n+4}{6}\right\rceil$. To show that $\alpha_{4}$ is edge $K_{4}$-irregular labeling it will be enough to show that $w t_{\alpha_{4}}\left(K_{4}^{i}\right)<w t_{\alpha_{4}}\left(K_{4}^{i+1}\right)$. It is a simple mathematical exercise that the weights of the subgraphs $K_{4}^{i}, i=1,2,3,4,5$ are $w t_{\alpha_{4}}\left(K_{4}^{i}\right)=5+i$.

For $i=6,7, \ldots, n-1$ we get

$$
\begin{aligned}
w t_{\alpha_{4}}\left(K_{4}^{i}\right) & =\sum_{e \in E\left(K_{4}^{i}\right)} \alpha_{4}(e)=\alpha_{4}\left(x_{i} x_{i+1}\right)+\alpha_{4}\left(y_{i} y_{i+1}\right)+\alpha_{4}\left(x_{i} y_{i}\right)+\alpha_{4}\left(x_{i+1} y_{i+1}\right) \\
& +\alpha_{4}\left(x_{i} y_{i+1}\right)+\alpha_{4}\left(x_{i+1} y_{i}\right)=\left\lceil\frac{i+1}{6}\right\rceil+\left\lceil\frac{i}{6}\right\rceil+\left\lceil\frac{i+2}{6}\right\rceil+\left\lceil\frac{i+3}{6}\right\rceil+\left\lceil\frac{i+5}{6}\right\rceil \\
& +\left\lceil\frac{i+4}{6}\right\rceil=5+i .
\end{aligned}
$$

This proves that $w t_{\alpha_{4}}\left(K_{4}^{i+1}\right)=w t_{\alpha_{4}}\left(K_{4}^{i}\right)+1$ for $i=1,2, \ldots, n-1$. Therefore, $\alpha_{4}$ is an edge $K_{4}$-irregular labeling of $D L_{n}$. Thus ehs $\left(D L_{n}, K_{4}\right) \leq\left\lceil\frac{n+4}{6}\right\rceil$. This concludes the proof.

## 4. Wheel and Gear Graph

A wheel $W_{n}, n \geq 3$, is a graph obtained by joining all vertices of cycle $C_{n}$ to a further vertex $c$, called the center. Thus $W_{n}$ contains $n+1$ vertices, say, $c, x_{1}, x_{2}, \ldots, x_{n}$ and $2 n$ edges, say, $c x_{i}, x_{i} x_{i+1}, 1 \leq i \leq n$, where the indices are taken modulo $n$.

Theorem 6. Let $W_{n}, n \geq 4$, be a wheel. Then

$$
\operatorname{ehs}\left(W_{n}, C_{3}\right)=\left\lceil\frac{n+2}{3}\right\rceil
$$

Proof. The wheel $W_{n}, n \geq 4$, admits a $C_{3}$-covering with exactly $n$ cycles $C_{3}$. Every cycle $C_{3}$ in $W_{n}$ is of the form $C_{3}^{i}=c x_{i} x_{i+1}$, where $i=1,2, \ldots, n$ with indices taken modulo $n$.

According to Theorem 1 we have that ehs $\left(W_{n}, C_{3}\right) \geq\left\lceil\frac{n+2}{3}\right\rceil$. To show that $\left\lceil\frac{n+2}{3}\right\rceil$ is an upper bound for the edge $C_{3}$-irregularity strength of $W_{n}$ we define a $C_{3}$-irregular edge labeling $\alpha_{5}: E\left(W_{n}\right) \rightarrow\left\{1,2, \ldots,\left\lceil\frac{n+2}{3}\right\rceil\right\}$ as follows.

$$
\begin{aligned}
& \alpha_{5}\left(x_{i} x_{i+1}\right)= \begin{cases}i & \text { for } i=1,2, \\
i-\left\lfloor\frac{i}{3}\right\rfloor & \text { for } 3 \leq i \leq\left\lceil\frac{n+1}{2}\right\rceil-1, \\
\left\lceil\frac{n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n+1}{2}\right\rceil, \\
n-i+1-\left\lfloor\frac{n-i}{3}\right\rfloor & \text { for }\left\lceil\frac{n+1}{2}\right\rceil+1 \leq i \leq n,\end{cases} \\
& \alpha_{5}\left(c x_{i}\right)= \begin{cases}1 & \text { for } i=1, \\
i-1-\left\lfloor\frac{i-2}{3}\right\rfloor & \text { for } 2 \leq i \leq\left\lceil\frac{n}{2}\right\rceil, \\
\left\lceil\frac{n+2}{3}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil+1 \text { and } n \equiv 0,1(\bmod 3), \\
\left\lceil\frac{n+2}{3}\right\rceil-1 & \text { for } i=\left\lceil\frac{n}{2}\right\rceil+1 \text { and } n \equiv 2(\bmod 3), \\
n-i+1-\left\lfloor\frac{n-i-1}{3}\right\rfloor & \text { for }\left\lceil\frac{n}{2}\right\rceil+2 \leq i \leq n-1, \\
2 & \text { for } i=n .\end{cases}
\end{aligned}
$$

It is a matter of routine checking that under the labeling $\alpha_{5}$ all edge labels are at most $\left\lceil\frac{n+2}{3}\right\rceil$. For the $C_{3}$-weight of the cycle $C_{3}^{i}$ we get

$$
\begin{aligned}
w t_{\alpha_{5}}\left(C_{3}^{i}\right) & =\alpha_{5}\left(c x_{i}\right)+\alpha_{5}\left(c x_{i+1}\right)+\alpha_{5}\left(x_{i} x_{i+1}\right) \\
& = \begin{cases}2 i+1 & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil \\
2(n+2-i) & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n\end{cases}
\end{aligned}
$$

Clearly, the weights of $C_{3}^{i}$ for $1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil$ are odd and increasing. On the other hand the weights of $C_{3}^{i}$ for $\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n$ are even and decreasing. So, it concludes that all the weights of $C_{3}^{i}$ are different. Thus $\alpha_{5}$ is an edge $C_{3}$-irregular labeling of $W_{n}$ and ehs $\left(W_{n}, C_{3}\right) \leq\left\lceil\frac{n+2}{3}\right\rceil$. This completes the proof.

A gear graph $G_{n}$ is obtained from $W_{n}$ by inserting a vertex to each edge on the cycle $C_{n}$. Then the vertex set of $G_{n}$ is $V\left(G_{n}\right)=\left\{c, x_{i}, y_{i}: 1 \leq i \leq n\right\}$ and the edge set is $E\left(W_{n}\right)=\left\{x_{i} y_{i}, y_{i} x_{i+1}, c x_{i}: 1 \leq i \leq n\right\}$ with indices taken modulo $n$.

Theorem 7. Let $G_{n}, n \geq 3$, be a gear graph. Then

$$
\operatorname{ehs}\left(G_{n}, C_{4}\right)=\left\lceil\frac{n+3}{4}\right\rceil .
$$

Proof. The gear $G_{n}, n \geq 3$, admits a $C_{4}$-covering with exactly $n$ cycles $C_{4}$. According to Theorem 1 we obtain that ehs $\left(G_{n}, C_{4}\right) \geq\left\lceil\frac{n+3}{4}\right\rceil$. To show that
$\left\lceil\frac{n+3}{4}\right\rceil$ is an upper bound for the edge $C_{4}$-irregularity strength of $G_{n}$ we define a $C_{4}$-irregular edge labeling $\alpha_{6}: E\left(G_{n}\right) \rightarrow\left\{1,2, \ldots,\left\lceil\frac{n+3}{4}\right\rceil\right\}$, in the following way.

$$
\begin{aligned}
\alpha_{6}\left(x_{i} y_{i}\right) & = \begin{cases}\left\lceil\frac{i}{2}\right\rceil & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil-1, \\
\left\lceil\frac{n}{4}\right\rceil & \text { for } i=\left\lceil\frac{n}{2}\right\rceil \text { and } n \not \equiv 2(\bmod 4), \\
\frac{n-2}{4} & \text { for } i=\frac{n}{2} \text { and } n \equiv 2(\bmod 4), \\
\left\lceil\frac{n-i+2}{2}\right\rceil & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n,\end{cases} \\
\alpha_{6}\left(y_{i} x_{i+1}\right) & = \begin{cases}\left\lceil\frac{i+1}{2}\right\rceil & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil, \\
\left\lceil\frac{n-i+1}{2}\right\rceil & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n,\end{cases} \\
\alpha_{6}\left(c x_{i}\right) & = \begin{cases}\left\lceil\frac{i}{2}\right\rceil & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil, \\
\left\lceil\frac{n-i+3}{2}\right\rceil & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n .\end{cases}
\end{aligned}
$$

It is easy to verify that under the labeling $\alpha_{6}$ all edge labels are at most $\left\lceil\frac{n+3}{4}\right\rceil$. For the $C_{4}$-weight of the cycle $C_{4}^{i}, i=1,2, \ldots, n$, under the edge labeling $\alpha_{6}$, we get

$$
\begin{aligned}
w t_{\alpha_{6}}\left(C_{4}^{i}\right) & =\sum_{e \in E\left(C_{4}^{i}\right)} \alpha_{6}(e)=\alpha_{6}\left(c x_{i}\right)+\alpha_{6}\left(c x_{i+1}\right)+\alpha_{6}\left(x_{i} y_{i}\right)+\alpha_{6}\left(y_{i} x_{i+1}\right) \\
& = \begin{cases}2 i+2 & \text { for } 1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil \\
2 n+5-2 i & \text { for }\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n\end{cases}
\end{aligned}
$$

Clearly, the weights of $C_{4}^{i}$ for $1 \leq i \leq\left\lceil\frac{n}{2}\right\rceil$ are even and increasing. On the other hand the weights of $C_{4}^{i}$ for $\left\lceil\frac{n}{2}\right\rceil+1 \leq i \leq n$ are odd and decreasing. So, it concluded that all the weights of $C_{4}^{i}$ are different. Thus $\alpha_{6}$ is an edge $C_{4^{-}}$ irregular labeling of $G_{n}$. Hence $\operatorname{ehs}\left(G_{n}, C_{4}\right) \leq\left\lceil\frac{n+2}{3}\right\rceil$. This completes the proof of theorem.

## 5. Conclusion

In this paper we have investigated the edge $H$-irregularity strength of some graphs. We have found the exact values of this parameter for several families of graphs namely, prisms, antiprisms, triangular ladders, diagonal ladders, wheels and gear graphs.
