Abstract

Let $D = (V(D), A(D))$ be a strongly connected digraph. An arc set $S \subseteq A(D)$ is a restricted arc-cut of $D$ if $D - S$ has a non-trivial strong component $D_1$ such that $D - V(D_1)$ contains an arc. The restricted arc-connectivity $\lambda'(D)$ is the minimum cardinality over all restricted arc-cuts of $D$. In [C. Balbuena, P. García-Vázquez, A. Hansberg and L.P. Montejano, On the super-restricted arc-connectivity of s-geodetic digraphs, Networks 61 (2013) 20–28], Balbuena et al. introduced the concept of super-$\lambda'$ digraphs.

In this paper, we first introduce the concept of the arc fault tolerance of a digraph $D$ on the super-$\lambda'$ property. We define a super-$\lambda'$ digraph $D$ to be $m$-super-$\lambda'$ if $D - S$ is still super-$\lambda'$ for any $S \subseteq A(D)$ with $|S| \leq m$. The maximum value of such $m$, denoted by $S_{\lambda'}(D)$, is said to be the arc fault tolerance of $D$ on the super-$\lambda'$ property. $S_{\lambda'}(D)$ is an index to measure the reliability of networks. Next we provide a necessary and sufficient condition for the Cartesian product of regular digraphs to be super-$\lambda'$. Finally, we give the lower and upper bounds on $S_{\lambda'}(D)$ for the Cartesian product $D$ of regular digraphs and give an example to show that the lower and upper bounds are best possible. In particular, the exact value of $S_{\lambda'}(D)$ is obtained in special cases.

Keywords: fault tolerance, restricted arc-connectivity, super-restricted arc-connectivity, Cartesian product, regular digraph.
