Abstract

The Clar number of a fullerene graph with $n$ vertices is bounded above by $\left\lfloor n/6 \right\rfloor - 2$ and this bound has been improved to $\left\lfloor n/6 \right\rfloor - 3$ when $n$ is congruent to 2 modulo 6. We can construct at least one fullerene graph attaining the upper bounds for every even number of vertices $n \geq 20$ except $n = 22$ and $n = 30$.

Keywords: fullerene, Clar number, Clar set, leapfrog transformation.
