Abstract

The balanced hypercube $BH_n$, defined by Wu and Huang, is a variant of the hypercube network $Q_n$, and has been proved to have better properties than $Q_n$ with the same number of links and processors. For a bipartite graph $G = (V_0 \cup V_1, E)$, we say $G$ is edge-hyper-Hamiltonian laceable if it is Hamiltonian laceable, and for any vertex $v \in V_i, i \in \{0, 1\}$, any edge $e \in E(G - v)$, there is a Hamiltonian path containing $e$ in $G - v$ between any two vertices of $V_{1-i}$. In this paper, we prove that $BH_n$ is edge-hyper-Hamiltonian laceable.

Keywords: balanced hypercubes, hyper-Hamiltonian laceability, edge-hyper-Hamiltonian laceability.
