Abstract

The $H$-force number $h(G)$ of a hamiltonian graph $G$ is the smallest cardinality of a set $A \subseteq V(G)$ such that each cycle containing all vertices of $A$ is hamiltonian. In this paper a lower and an upper bound of $h(G)$ is given. Such graphs, for which $h(G)$ assumes the lower bound are characterized by a cycle extendability property. The $H$-force number of hamiltonian graphs which are exactly 2-connected can be calculated by a decomposition formula.

Keywords: cycle, hamiltonian graph, $H$-force number, cycle extendability.
